Conducting Polymers with Micro or Nanometer Structure Meixiang Wan, 2009-03-15 Conducting Polymers with Micro or Nanometer Structure describes a topic discovered by three winners of the Nobel Prize in Chemistry in 2000: Alan J. Heeger (University of California at Santa Barbara), Alan G. MacDiarmid (at the University of Pennsylvania) and Hideki Shirakawa (at the University of Tsukuba). Since then the unique properties of conducting polymers have led to promising applications in functional materials and technologies. The book first briefly summarizes the main concepts of conducting polymers before introducing micro nanostructured conducting polymers dealing with their synthesis, structural characterizations, formation mechanisms, physical and chemical properties and potential applications in nanomaterials and nanotechnology. The book is intended for researchers in the related fields of chemistry, physics, materials, nanomaterials and nanodevices. Meixiang Wan is a professor at the Institute of Chemistry, Chinese Academy of Sciences, Beijing.

Conjugated Conducting Polymers Helmut Kiess, 2012-12-06 This book reviews the current understanding of electronic, optical and magnetic properties of conjugated polymers in both the semiconducting and metallic states. It introduces in particular novel phenomena and concepts in these quasi one dimensional materials that differ from the well established concepts valid for crystalline semiconductors. After a brief introductory chapter the second chapter presents basic theoretical concepts and treats in detail the various models for n conjugated polymers and the computational methods required to derive observable quantities. Specific spatially localized structures often referred to as solitons, polarons and bipolarons result naturally from the interaction between n electrons and lattice displacements. For a

semi quantitative understanding of the various measurements electron-electron interactions have to be incorporated in the models this in turn makes the calculations rather complicated The third chapter is devoted to the electrical properties of these materials The high metallic conductivity achieved by doping gave rise to the expression conducting polymers which is often used for such materials even when they are in their semiconducting or insulating state Although conductivity is one of the most important features the reader will learn how difficult it is to draw definite conclusions about the nature of the charge carriers and the microscopic transport mechanism solely from electrical measurements Optical properties are discussed in the fourth chapter

Solitons and Polarons in Quasi-one Dimensional Conducting Polymers and Related Materials, 1983 In recent years it has become increasingly appreciated that fundamentally nonlinear excitations solitons play an essential role in an incredible variety of natural systems These solitons which frequently exhibit remarkable stability under interactions and perturbations often dominate the transport response or structural properties of the systems in which they occur In this article we present an introduction to the solitons that occur in quasi one dimensional conducting polymers synmetals and related systems The relevance of this subject to molecular electronic devices is twofold First many of these materials have molecular structures similar to possible prototype molecular switches Second to understand in detail how a molecular electronic device could work it is essential to have a broad perspective on the nature of possible excitations in a variety of natural and synthetic molecular materials 51 references
