SKELETAL SYSTEM

THE FRAMEWORK OF THE HUMAN BODY

Read the text below and then answer the questions.

The skeletal system, or skeleton, is made of bones, cartilage, ligaments, and ligaments. It is one of the most important parts of the human body. Its main function is to support the body and protect the internal organs. It also plays a role in movement and blood production. In the adult human body, the skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

Bones, the fundamental building blocks of the skeletal system, are made of living tissue and are constantly being replaced. They are made of a hard, mineralized substance called hydroxyapatite. The main function of bones is to support the body and protect the internal organs. They also play a role in movement and blood production. In the adult human body, the skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

Cartilage is a flexible, non-mineralized connective tissue that is found in the joints of the skeletal system. It allows the bones to move and absorb shock. It is made of a soft, rubbery substance called chondroitin. The main function of cartilage is to support the body and protect the internal organs. They also play a role in movement and blood production. In the adult human body, the skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

Ligaments are strong, fibrous bands of connective tissue that connect the bones to each other. They are made of a tough, rubbery substance called collagen. The main function of ligaments is to support the body and protect the internal organs. They also play a role in movement and blood production. In the adult human body, the skeletal system is a dynamic and interconnected network that adapts to the needs of the body.

The skeletal system is not a static entity but rather a dynamic and adaptive one. Throughout life, bones are being replaced and repaired. This process is called bone remodeling. It is a complex process that involves the removal of old bone and the formation of new bone. The main function of the skeletal system is to support the body and protect the internal organs.
