

# How Optical Fibre Works

Optical fibre is a very thin strand of glass or plastic capable of transmitting light from one point to another. It is also known as an optical waveguide, since it is a medium that guides light.

Data travels down the fibre in the form of light. Voice, video, text, all forms of digital data can be encoded into pulses of light and re-encoded into zeros and ones (the basic form of all digital information) at its destination.

**A fibre optic communication system** generally consists of five stages: An encoder or modulator connected to a transmitter processes the data from an electronic to optical signal and launches it into the fibre.

To avoid attenuation (a gradual loss in signal strength), repeaters are used to periodically amplify the signal during its passage through the optical cable.

When the signal arrives at the destination, it is received by a detector and reconverted to an electrical signal, which is then sent to a demodulator which decodes the structure of the original signal and which is sent on to the various devices.

## Advantages of Fibre Optic Cable over Copper

**Speed** Fibre optic networks operate at high speeds - the NBN promises to deliver up to 100Mbps initially, but the network can be updated to deliver content into the gigabyte range.

**Bandwidth** Large carrying capacity.

**Distance** Signals can be transmitted further without needing to be "refreshed" or strengthened. In high quality fibre signals can be sent 30km before losing strength.

**Resistance** Fibre optic has far greater resistance to electromagnetic noise such as radios, motors or other nearby cables.

**Maintenance** Fibre optic cable networks cost less to maintain than copper networks.

**Lenore Tawney** Karen Patterson, 2019-10-04 Recent years have seen an enormous surge of interest in fiber arts with works made of thread on display in art museums around the world But this art form only began to transcend its origins as a humble craft in the late nineteenth and early twentieth centuries and it wasn't until the 1950s and 1960s that artists used the fiber arts to build critical practices that challenged the definitions of painting drawing and sculpture One of those artists was Lenore Tawney 1907 2007 Raised and trained in Chicago before she moved to New York Tawney had a storied career She was known for employing an ancient Peruvian gauze weave technique to create a painterly effect that appeared to float in space rather than cling to the wall as well as for being one of the first artists to blend sculptural techniques with weaving practices and in the process pioneered a new direction in fiber art Despite her prominence on the New York art scene however she has only recently begun to receive her due from the greater art world Accompanying a retrospective at the John Michael Kohler Arts Center this catalog features a comprehensive biography of Tawney additional essays on her work and two hundred full color illustrations making it of interest to contemporary artists art historians and the growing audience for fiber art Copublished with the John Michael Kohler Arts Center

Conjugated polymer composites with high dielectric constants are being developed by the electronics industry in response to the need for power grounded decoupling to secure the integrity of high speed signals and to reduce electromagnetic interference Electrically conducting polymers are materials that simultaneously possess the physical and chemical properties of organic polymers and the electronic characteristics of metals Multifunctional micro and nanostructures of conjugated polymers such as of pyrrole have received great attention in recent years because they can polymerize easily and have high conductivity and good thermal stability They however have some disadvantages such as brittleness and hard processability which can be overcome by developing their nanocomposites Nanofiber materials with different dielectric properties can be made from conjugated polymer composites and used in the electronics industry in sensors and batteries for electrical stimulation to enhance nerve regeneration process and for constructing scaffolds for nerve tissue engineering
