Soil, Water, and Crop Production David Wynne Thorne, Marlowe D. Thorne, 1979 **Soil, Water, and Crop/livestock Management Systems for Rainfed Agriculture in the Near East Region**, 1989 Water Use in Crop Production M.b. Kirkham, 2000-04-05 Make the best use of available water for your crops Water Use in Crop Production explores innovative methods that determine how much water certain crops need in certain climates in order to ensure adequate plant growth and help eliminate water waste Through this informative book agronomists growers researchers and graduate students will find methods and techniques for effective water management that will save money and conserve water Water Use in Crop Production will enable you enhance crop quality and quantity and save one of the earth s most important resource Comprehensive and thorough this essential book combines two vital needs food and water and examines what must be done in order to keep up with the ever growing human population Explaining conservation techniques used in Argentina Australia Israel Morocco New Zealand the Philippines Spain and the United States Water Use in Crop Production will help you achieve this goal as it discusses water management measures including avoiding excessive deep percolation reducing runoff lessening water evaporation through methods such as reducing the capillary water flow to the surface of the soil determining the rates at which water is demanded and can be supplied in a specific area to create a plan for limiting water loss studying the root structure of plants to calculate how much water they need using deficit irrigation to help plants save water for future use evaluating citrus water use through the Penman Monteith model Containing charts tables and examples of the concepts it discusses this book is the culmination of the latest studies on water storage Water Use in Crop Production provides you with reliable strategies and methods that will help you lessen water expenditures and improve the vitality of crops anywhere in the world Simulation of Field Water Use and Crop Yield R. Irrigation Water Salinity and Crop Production , **Soils, Plant Growth and Crop Production - Volume I** Willy H. Verheye, 2010-11-30 Soils Plant Growth and Crop Production is a component of Encyclopedia of Food and Agricultural Sciences Engineering and Technology Resources in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty Encyclopedias Plants and crops in particular grow and develop through the uptake of

water and nutrients by the root system in soils and their transformation into biomass through processes governed by photosynthesis. The quality and amount of products harvested from this biomass depend largely on the intrinsic properties of the soil, i.e. the moisture and nutrients made available for uptake by the roots. These volumes describe in a synthetic form the impact of the most important soil properties on general agronomy, crop production, cultivation methods and yields, including the specific management aspects which take away some production constraints. Changes in general agronomy as a result of plant breeding, climatic change and competition between newly introduced crops are discussed. The three volumes with contributions from distinguished experts in the field discuss about soils, plant growth and crop production in several related topics. These volumes are aimed at the following five major target audiences: University and College students, Educators, Professional practitioners, Research personnel and Policy analysts, managers and decision makers and NGOs.

Optimizing The Soil Physical Environment Toward Greater Crop Yields Daniel Hillel, 2012-12-02. Optimizing the Soil Physical Environment Toward Greater Crop Yields contains the proceedings of an invitational panel convened during the International Symposium on Soil Water Physics and Technology held at The Hebrew University Faculty of Agriculture in Rehovot, Israel, August 29 to September 5, 1971. Organized into 13 chapters, this book begins with a discussion on the criteria for determining the aims and direction of research in soil physics and technology. Some chapters deal with the transformation and fluxes of energy and matter in the field, particularly water, soil temperature, soil structure, soil salinity, radiation, climate and nutrient supply and uptake. The book also explores the methods of measuring, managing and modifying the crop production system to greater agricultural advantage. This book will reflect not only what is known but also what is missing in the incomplete conception of this environment.

Water and Crop Growth A.K. Kolay, 2008. No crop can be grown without being adequately supplied with the requisite amount of water at the proper time. A thorough knowledge of the hydrological cycle, amount and distribution of rainfall, water resources and irrigation projects in India facilitates efficient utilization of water for crop production. Inadequate supply of water to crops in semi arid and arid regions adversely affects agricultural production. Properties of water, the mode of its entry into the soil and its absorption by roots of crops are important for irrigation. This necessitates accurate determination of the soil moisture content, the plants and available water which is essential for growth and yield of crops. Its deficiency adversely affects their growth and yield. Irrigation must be extended to unirrigated areas in order to increase the production of food, fibre and fodder for which we must know the source of irrigation water, units and methods of measurement of water, methods of irrigating crop fields, factors affecting the choice of irrigation methods, the degree of the suitability of the available water for irrigating crops and the factors affecting the suitability of water for irrigation. As water is a relatively scarce commodity, we must know whether water of a little inferior quality can be utilized to irrigate crops. In addition, we must be familiar with the precautions which need to be taken in this regard. The accumulation of excess water in the soils of the crop fields affects the growth of crops adversely enough to reduce their yields. Choice of the

method of land drainage varies with the variation in the topography of the land. It is also necessary to rectify the causes of waterlogging to bring the waterlogged land back under the plough to increase agricultural production. This necessitates drainage investigation and laying out of the proper drainage system. Water requirement of crops depends on the climate and the crop. More water is required to produce crops in the arid region than in the humid region. Crops like paddy and sugar cane require much larger amount of water than finger millet and pearl millet. The book extensively deals with all these aspects related to soil and crop production and suggests measures to enhance productivity through water conservation and proper management of water resources. It will be highly useful for the students, teachers and researchers working in this field. Besides agriculturists and general readers will also find it useful and informative. Water Resources Research Catalog, 1966. *Efficient Soil Water Use* N. van Duivenbooden, International Crops Research Institute for the Semi-Arid Tropics, International Center for Agricultural Research in the Dry Areas, 1999. *Soil Water and Agronomic Productivity* Rattan Lal, B.A. Stewart, 2012-06-19. Crop water use can be increased by management of surface runoff, groundwater irrigation and soil water. Technological innovations to enhance availability of water for agricultural crops depend on soil and site specific conditions. Devoted to the principles and practices of enhancing water use efficiency, *Soil Water and Agronomic Productivity* addresses current problems associated with water supplies required for agricultural purposes and food production. Written for professionals and students in agricultural fields, the book focuses on innovative technologies for improving soil water availability, enhancing water use efficiency and using productive irrigation systems. It also presents techniques to conserve water in the root zone as well as remote sensing techniques to assess soil water regime and predict drought on a regional scale. Soil water management is crucial to reducing the vulnerability to agronomic drought. There are numerous examples of aquifers that have been severely depleted by misuse and mismanagement. *Soil Water and Agronomic Productivity* explains the factors and causes of the mismanagement of soil water and proposes options for sustainable and efficient use of scarce water resources. Meeting the global food demand will require careful worldwide management of soil and water resources and this can only be done by sharing information and knowledge. Part of the *Advances in Soil Science Series*. **Water and Sustainable Agriculture** Iván Francisco García-Tejero, Víctor Hugo Durán-Zuazo, José Luis Muriel-Fernández, Carmen Rocío Rodríguez-Pleguezuelo, 2011-08-03. Irrigated agriculture, a vital component of general agriculture, supplies fruits, vegetables and cereals consumed by humans and grains fed to animals. Consequently, agriculture is the largest user of fresh water globally and irrigation practices in many parts of the world are biologically, economically and socially unsustainable. Water management should balance the need for agricultural water and the need for a sustainable environment. Water use efficiency is the prime challenge in worldwide farming practices where problems of water shortages are widespread. Currently, agriculture is undergoing significant changes in innovative irrigation, fertilizer technology and agronomic expertise. These elements constitute a vital platform for sustainable agricultural success and for preventing

environmental damage This review presents several processes linked to environmental irrigation balancing environmental protection with improved agricultural production
