Integrating Scientific Disciplines William Bechtel, 2012-12-06

Interdisciplinary research has been a popular idea with many people in the last 20 years Academic administrators have admonished their faculty to become more interdisciplinary Students often request the chance to pursue an interdisciplinary degree While the issue of managing interdisciplinary projects has received a fair amount of attention by those interested in science management interdisciplinary research has received little attention from historians philosophers or sociologists of science or from scientists themselves Yet there are a number of cases within the life sciences where researchers have been actively engaged in endeavors that take them across disciplinary boundaries These are ripe for investigation by those interested in the process of science To provide an in depth study of some historical or contemporary cases of cross disciplinary research activity in the life sciences a conference was held at Georgia State University in May 1984 This conference was supported by the National Endowment for the Humanities U S A through their research conference program Over a three day period historians philosophers and researchers who were actively engaged in various of the life sciences discussed specific examples of interdisciplinary research and tried to analyze what was needed for successful crossing of disciplinary boundaries After the conference each of the participants revised their original presentations partly in light of the

discussion at the conference The papers in this volume are the fruits of that endeavor **1979-1990 Henryk Sawoniak, 2012-02-14** No detailed description available for 1979 1990 **Encyclopedia of Science and Technology Communication** Susanna Hornig Priest, 2010-07-14 The explosion of scientific information is exacerbating the information gap between richer poorer educated less educated publics The proliferation of media technology and the popularity of the Internet help some keep up with these developments but also make it more likely others fall further behind This is taking place in a globalizing economy and society that further complicates the division between information haves and have nots and compounds the challenge of communicating about emerging science and technology to increasingly diverse audiences Journalism about science and technology must fill this gap yet journalists and journalism students themselves struggle to keep abreast of contemporary scientific developments Scientist aided by public relations and public information professionals must get their stories out not only to other scientists but also to broader public audiences Funding agencies increasingly expect their grantees to engage in outreach and education and such activity can be seen as both a survival strategy and an ethical imperative for taxpayer supported university based research Science communication often in new forms must expand to meet all these needs Providing a comprehensive introduction to students professionals and scholars in this area is a unique challenge because practitioners in these fields must grasp both the principles of science and the principles of science communication while understanding the social contexts of each For this reason science journalism and science communication are often addressed only in advanced undergraduate or graduate specialty courses rather than covered exhaustively in lower division courses Even so those entering the field rarely will have a comprehensive background in both science and communication studies This circumstance underscores the importance of compiling useful reference materials The Encyclopedia of Science and Technology Communication presents resources and strategies for science communicators including theoretical material and background on recent controversies and key institutional actors and sources Science communicators need to understand more than how to interpret scientific facts and conclusions they need to understand basic elements of the politics sociology and philosophy of science as well as relevant media and communication theory principles of risk communication new trends and how to evaluate the effectiveness of science communication programmes to mention just a few of the major challenges This work will help to develop and enhance such understanding as it addresses these challenges and more Topics covered include advocacy policy and research organizations environmental and health communication philosophy of science media theory and science communication informal science education science journalism as a profession risk communication theory public understanding of science pseudo science in the news special problems in reporting science and technology science communication ethics Work at the Boundaries of Science C.L. Palmer, 2013-06-29 Interdisciplinary inquiry has become more pervasive in recent decades yet we still know little about the conduct of this type of research or the information problems associated with it This book is one of few empirical studies of

interdisciplinary knowledge practices It examines how interdisciplinary scientists discover and exchange information and knowledge highlighting how the boundaries between disciplines affect how information is used and how knowledge is constructed It is written for scholars and practitioners with an interest in developing information systems and research environments to foster innovative scientific work Target groups include researchers in information science science studies communication as well as research administrators and information professionals

General Philosophy of Science: Focal Issues, 2007-07-18 Scientists use concepts and principles that are partly specific for their subject matter but they also share part of them with colleagues working in different fields Compare the biological notion of a natural kind with the general notion of confirmation of a hypothesis by certain evidence Or compare the physical principle of the conservation of energy and the general principle of the unity of science Scientists agree that all such notions and principles aren't as crystal clear as one might wish An important task of the philosophy of the special sciences such as philosophy of physics of biology and of economics to mention only a few of the many flourishing examples is the clarification of such subject specific concepts and principles Similarly an important task of general philosophy of science is the clarification of concepts like confirmation and principles like the unity of science It is evident that clarification of concepts and principles only makes sense if one tries to do justice as much as possible to the actual use of these notions by scientists without however following this use slavishly That is occasionally a philosopher may have good reasons for suggesting to scientists that they should deviate from a standard use Frequently this amounts to a plea for differentiation in order to stop debates at cross purposes due to the conflation of different meanings While the special volumes of the series of Handbooks of the Philosophy of Science address topics relative to a specific discipline this general volume deals with focal issues of a general nature After an editorial introduction about the dominant method of clarifying concepts and principles in philosophy of science called explication the first five chapters deal with the following subjects Laws theories and research programs as units of empirical knowledge Theo Kuipers various past and contemporary perspectives on explanation Stathis Psillos the evaluation of theories in terms of their virtues Ilkka Niiniluoto and the role of experiments in the natural sciences notably physics and biology Allan Franklin and their role in the social sciences notably economics Wenceslao Gonzalez In the subsequent three chapters there is even more attention to various positions and methods that philosophers of science and scientists may favor ontological epistemological and methodological positions James Ladyman reduction integration and the unity of science as aims in the sciences and the humanities William Bechtel and Andrew Hamilton and logical historical and computational approaches to the philosophy of science Atocha Aliseda and Donald Gillies The volume concludes with the much debated question of demarcating science from nonscience Martin Mahner and the rich European American history of the philosophy of science in the 20th century Friedrich Stadler Comprehensive coverage of the philosophy of science written by leading philosophers in this field Clear style of writing for an interdisciplinary audience No specific pre knowledge required

Chemistry in America 1876-1976

A. Thackray, J.L. Sturchio, P.T. Carroll, R.F. Bud, 2012-12-06 This study is an outgrowth of our interest in the history of modern chemistry. The paucity of reliable quantitative knowledge about past science was brought home forcibly to us when we undertook a research seminar in the comparative history of modern chemistry in Britain, Germany and the United States. That seminar, which took place at the University of Pennsylvania in the spring of 1975, was paralleled by one devoted to the work of the Annales School. The two seminars together catalyzed the attempt to construct historical measures of change in aspects of one science or chemical indicators. The present volume displays our results. Perhaps our labors may be most usefully compared with the work of those students of medieval science who devote their best efforts to the establishment of texts. Only when acceptable texts have been constructed from fragmentary and corrupt sources can scholars move on to the more satisfying business of making history. So too in the modern period a necessary preliminary to the full history of any scientific profession is the establishing of reliable quantitative information in the form of statistical series. This volume does not offer history. Instead it provides certain element indicators that may be useful to individuals interested in the history of American chemistry and chemical industry and suggestive for policy.

Science Studies David J. Hess, 1997-10-01 The first comprehensive survey of this interdisciplinary field combining a concise overview of key concepts with an original and integrated framework. Virtually every aspect of modern life is suffused with the byproducts of scientific research yet the study of science itself, what it is, how it is done, and how it has evolved over time, is relatively new. By examining the political, historical, and cultural dimensions of science and technology, science studies provides a conceptual tool kit for thinking about scientific in more sophisticated ways. In the process of bringing disparate fields together under one tent, David J. Hess realizes the full promise of science studies long uncomfortably squeezed into other more traditional disciplines. He provides a clear discussion of the issues and misunderstandings that have arisen in these interdisciplinary conversations. His survey includes recent developments in philosophy, sociology, anthropology, history, cultural studies, and feminist studies. Science Studies moves beyond the discipline-bound blinders of a sociology, history, philosophy, or anthropology of science. By creating its own transdisciplinary field, Hess argues, science studies can provide crucial conceptual tools for public discussions about the role of science and technology in a democratic society.

Harriet Brooks Marelene F. Rayner-Canham, Geoffrey W. Rayner-Canham, 1992-02-07 After completing a master's degree at McGill University under Rutherford's tutelage, Brooks continued her postgraduate work at Bryn Mawr College and Cambridge University, eventually returning to McGill to work again with Rutherford. In 1904 she left Canada to work at Barnard College in New York City and then with Curie in Paris. Brooks had a significant career as a nuclear scientist, but her success was hampered by the fact that she was a woman. She eventually married and left research. Her premature death at age fifty-six was probably related to her work with radiation.
