Solute Modelling In Catchment Systems:

Solute Modelling in Catchment Systems Stephen T. Trudgill, 1995-11-06 Stephen Trudgill presents an internationally authored research level text aimed at providing a synopsis of developments in solute modelling in catchment ecosystems over the last ten years The volume includes particular advances in solute modelling especially at the catchment scale emphasising the influences of weathering ecosystem processes and hydrological processes as well as the application of models and modelling principles The intended audience for the book is research scientists in cognate fields and postgraduate research workers although it is especially aimed at those interested in catchment systems It will also enable specialists to grasp the essentials of topics outside their own field The book will be of use in a management context as successful water quality management actions are often dependent upon the predictive success of models It will also show how models can be used to assess the sensitivity of solute production to environmental change and human influence such as land use change and variation in atmospheric inputs focussing upon surface catchments rather than groundwater and soil solutes

Mathematical Models of Small Watershed Hydrology and Applications Vijay P. Singh, Donald K. Frevert, 2002

Comprehensive account of some of the most popular models of small watershed hydrology and application of interest to all hydrologic modelers and model users and a welcome and timely edition to any modeling library Modelling Soil Erosion, Sediment Transport and Closely Related Hydrological Processes Wolfgang Summer, Eduard Klaghofer, Wei Zhang, 1998

Handbook of Erosion Modelling R. P. C. Morgan, Mark Nearing, 2016-04-13 The movement of sediment and associated pollutants over the landscape and into water bodies is of increasing concern with respect to pollution control prevention of muddy floods and environmental protection In addition the loss of soil on site has implications for declining agricultural productivity loss of biodiversity and decreased amenity and landscape value The fate of sediment and the conservation of soil are important issues for land managers and decision makers In developing appropriate policies and solutions managers and researchers are making greater use of erosion models to characterise the processes of erosion and their interaction with the landscape A study of erosion requires one to think in terms of microseconds to understand the mechanics of impact of a single raindrop on a soil surface while landscapes form over periods of thousands of years These processes operate on scales of millimetres for single raindrops to mega metres for continents Erosion modelling thus covers quite a lot of ground This book introduces the conceptual and mathematical frameworks used to formulate models of soil erosion and uses case studies to show how models are applied to a variety of purposes at a range of spatial and temporal scales The aim is to provide land managers and others with the tools required to select a model appropriate to the type and scale of erosion problem to show what users can expect in terms of accuracy of model predictions and to provide an appreciation of both the advantages and limitations of models Problems covered include those arising from agriculture the construction industry pollution and climatic change and range in scale from farms to small and large catchments The book will also be useful to students and

research scientists as an up to date review of the state of art of erosion modelling and through a knowledge of how models are used in practice in highlighting the gaps in knowledge that need to be filled in order to develop even better models

Assessment of Non-Point Source Pollution in the Vadose Zone Dennis L. Corwin, Keith Loague, Timothy R. Ellsworth, 1999-01-26 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 108 Non point source NPS pollution in the vadose zone simply defined as the layer of soil extending from the soil surface to the groundwater table is a global environmental problem Characteristically NPS pollutants are widespread and occasionally ubiquitous in extent thus making remediation efforts difficult and complex have the potential for maintaining a relatively long active presence in the global ecosystem and may result in long term chronic health effects in humans and other life forms Similar to other global environmental issues the knowledge and information required to address the problem of NPS pollutants in the vadose zone cross several technological and subdisciplinary lines spatial statistics geographic information systems GIS hydrology soil science and remote sensing Cooperation between disciplines and scientific societies is essential to address the problem Evidence of such cooperation was the jointly sponsored American Geophysical Union Chapman Soil Science Society of America SSSA Outreach Conference that occurred in October 1997 entitled Applications of GIS Remote Sensing Geostatistics and Solute Transport Modeling to the Assessment of Non Point Source Pollution in the Vadose Zone The objective of the conference and this book which was developed from the conference was to explore current multidisciplinary research for assessing NPS pollution in soil and groundwater resources

Biogeochemical Monitoring in Small Catchments Jirí Cerný, Martin Novák, Tomáš Paces, R. Kelman Wieder, 2012-12-06 This Special Issue of Water Air and Soil Pollution offers original contributions from BIOGEOMON an international symposium on ecosystem behavior and the evaluation of integrated monitoring of small catchments held in Prague Czech Republic in September 1993 The meeting attracted nearly 200 scientists from 27 countries on five continents BIOGEOMON was a loose continuation of another international meeting GEOMON which was held in Prague in 1987 Both symposia provided a forum for the discussion of ideas on environmental problems in western and eastern Europe with important contributions from the American continent With the dramatic collapse of the iron curtain it was our hope that more so than GEOMON BIOGEOMON would provide opportunities for the free exchange of ideas fostering the development of research collaborations between its participants With international openness comes the increasing realization that every industrialized nation has its own legacy of environmental degradation Anthropogenic impacts differ in severity and scale air and water transport of pollutants transform local impacts into regional and global ones ignoring political boundaries and economic differences Environmental consequences of anthropogenic activities often are detectable at the ecosystem level Thus the challenge of ecosystem science and to the individuals who practice it is to develop a comprehensive understanding of ecosystem function in the past and at present and to apply such understanding toward minimizing future insults to the local regional and global environment

Environmental Foresight and Models M.B. Beck, 2002-03-20 Policy makers and the public it has famously been said are more interested in the possibility of non linear dislocations and surprises in the behaviour of the environment than in smooth extrapolations of current trends The International Task Force in Forecasting Environmental Change 1993 1998 dedicated its work to developing procedures of model building capable of addressing our palpable concerns for substantial change in the future This volume discusses the immense challenges that such structural change presents that the behaviour of the environment may become radically different from that observed in the past and investigates the potentially profound implications for model development Drawing upon case histories from the Great Lakes acidic atmospheric deposition and among others the urban ozone problem this discourse responds to a new agenda of questions For example What system of radar might we design to detect threats to the environment lying just beyond the horizon and Are the seeds of structural change identifiable within the record of the recent past Meticulously researched by leading environmental modellers this milestone volume engages vigorously with its subject and offers an animated account of how models can begin to take into consideration the significant threats and uncertainties posed by structural change **Hydrochemistry** International Association of Hydrological Sciences.
