Extreme Ultraviolet Astronomy Martin A. Barstow, Jay B. Holberg, 2003-03-13 This text describes the development of astronomy in the Extreme Ultraviolet EUV wavelength range from the first rocket based experiments in the late 1960s through to later satellite missions Discussions of the results from important space projects are followed by an analysis of the contributions made by EUV astronomy to the study of specific groups of astronomical objects Within this framework the book provides detailed material on the tools of EUV astronomy dealing with the instrumentation observational techniques and modelling tools for the interpretation of data Prospects for future EUV missions are discussed and a catalogue of the known EUV sources is included This book will be of great value to graduate students and researchers It gives a complete overview of Extreme Ultraviolet astronomy Hartung's Astronomical Objects For Southern Telescopes David Frew, David

Malin, 2016-09-09 Many of the most spectacular and interesting astronomical objects are found in the magnificent southern skies Professor E J Hartung first produced a comprehensive and highly respected guide for southern observers in 1968 The book was thoroughly revised expanded in 1995 enhancing its essential character as an indispensable source of information for the active observer of the night sky Nearly 200 objects are illustrated in black and white and much new background material has been included about the constellations and celestial coordinate systems as well as a more modern description of the stars nebulae and galaxies New tables include a southern Messier list of objects The authors passion for their subject makes this a unique and inspirational book Dark Companions of Stars P. Kamp, 2012-12-06 If you want to understand the

invisible look careful at the visible The Talmud A bird s eye or rather a distant spacecraft s view of the solar system reveals an assembly of planets terrestrial giant and Pluto The orbital motions are in the same sense counter clockwise as seen from the north of the general flattened space within which the planetary motions are confined This state of affairs is corevolving and more or less coplanar The rotations are in the same sense as the revolutions with the striking exception of Uranus whose sense of rotation is perpendicular to its plane of revolution As time goes by most of the planets remain fairly close to a general plane and at no time stray unduly far from it they remain confined within a rather narrow box or disk with a large equatorial extent The most distant planet Pluto requires a diameter of some 80 astronomical units for the disk One astronomical unit is the distance of the Earth to the Sun to be more precise the length of half the major axis of the Earth s slightly elliptical orbit around the Sun and amounts to nearly 149600000 km A Year of the Stars Fred Schaaf, 2010-08-25

Planets Outside the Solar System: Theory and Observations Jean-Marie Mariotti, D.M. Alloin, 2012-12-06 The question of the existence of other worlds and other living beings has been present in the human quest for knowledge since as far as Epicurus For centuries this question belonged to the fields of philosophy and theology The theoretical problem of the formation of the Solar System and hence of other planetary systems was tackled only during the 18th century while the first observational attempts for a detection started less than one hundred years ago Direct observation of an extra solar planetary

system is an extraordinarily difficult problem extra solar planets are at huge distances are incredibly faint and are overwhelmed by the bright light of their own stars With virtually no observational insight to test their models theoreticians have remained for decades in a difficult position to make substantial progress Yet the field of stellar formation has provided since the 1980s both the theoretical and observational evidences for the formation of discs at the stage of star birth and for debris materials orbiting the very young stellar systems It was tempting to consider that these left overs might indeed later agglomerate into planetary systems more or less similar to ours Then came observational evidences for planets outside the Solar System

Can Star Systems Be Explored?: The Physics Of Star Probes Lawrence Barr Crowell, 2007-11-22 This book is an exposition of classical mechanics and relativity that addresses the question of whether it is possible to send probes to extrasolar systems It examines largely well understood physics to consider the possibility of exploring the nearby interstellar environment in a similar fashion to how the solar system has been explored As such this book is both a semipopularization of basic physics and an informal study of a likely future technological development An auxilliary text on basic physics for students and laypersons as well as an illustration of the problems with interstellar exploration this book is a must read
