Solar Flares:

Solar Flares Zdenek Svestka, 2012-12-06 This book is the first part of the originally planned publication by Z Svestka and L D de Feiter Solar High Energy Photon and Particle Emission The second part with the original title was to be published by de Feiter in about one year from now However to the deep sorrow of all of us Dr de Feiter died suddenly and unexpectedly when the present book was in print Thus unfortunately de Feiter's second part may not appear Due to the fact that the originally planned publication was divided into two parts the present book is mainly descriptive and concerned with the flare morphology It was expected that theoretical interpretations would be extensively developed in the second part prepared by de Feiter In particular this refers to the theoretical backgrounds of radio emissions particle acceleration and particle propagation in space Only in Chapter II concerning the low temperature flare do we go deeper into the theoretical interpretations anticipating that de Feiter would have been concerned mainly with the high energy physics Still the book includes discussions on all important aspects of flares and thus can present the reader with a complete picture of the complex flare phenomenon It is clear that many observed data on flares can be interpreted in different ways

Vanessa Polito,Bart de Pontieu,Adam Kowalski,Viggo Hansteen,2023-12-27 Since its launch in 2013 IRIS has observed more than 10 X class over 100 M class and more than 600 C class flares at unprecedented spatial and temporal resolution Thanks to the rich diagnostics that cover the physical conditions of the solar atmosphere from the photosphere to the hottest parts of the flaring corona IRIS observations have provided exciting new results and constraints on flare heating models significantly expanding our knowledge of how flares are triggered and how the non thermal energy is released propagates downward from the corona and is deposited in the low atmosphere At the same time the new discoveries provided by IRIS have raised new unresolved questions and new challenges for theoretical models For instance current hydrodynamic models still cannot fully explain many features observed by IRIS during both the impulsive and gradual phases such as the dynamics of the evaporative condensation flows the large line broadenings and the puzzling complex and broad chromospheric lines In addition important questions remain regarding the details of the energy propagation and dissipation in flares the importance of Alfvén waves vs electron beam and thermal conduction heating and the effects from large scale reconfiguration of the magnetic field during flares *Literature 1987, Part 1* S.
