Spectral Analysis Of Time Series:

Spectral Analysis of Time Series Bernard Harris, 1967 **Spectral Analysis for Univariate Time Series** Donald B. Percival, Andrew T. Walden, 2020-03-19 Spectral analysis is widely used to interpret time series collected in diverse areas This book covers the statistical theory behind spectral analysis and provides data analysts with the tools needed to transition theory into practice Actual time series from oceanography metrology atmospheric science and other areas are used in running examples throughout to allow clear comparison of how the various methods address questions of interest All major nonparametric and parametric spectral analysis techniques are discussed with emphasis on the multitaper method both in its original formulation involving Slepian tapers and in a popular alternative using sinusoidal tapers The authors take a unified approach to quantifying the bandwidth of different nonparametric spectral estimates An extensive set of exercises allows readers to test their understanding of theory and practical analysis The time series used as examples and R language code for recreating the analyses of the series are available from the book s website **Spectral Analysis of Time-series Data** Rebecca M. Warner, 1998-05-22 This book provides a thorough introduction to methods for detecting and describing cyclic patterns in time series data It is written both for researchers and students new to the area and for those who have already collected time series data but wish to learn new ways of understanding and presenting them Facilitating the interpretation of observations of behavior physiology mood perceptual threshold social indicator variables and other responses the book focuses on practical applications and requires much less mathematical background than most comparable texts Using real data sets and currently available software SPSS for Windows the author employs extensive examples to clarify key concepts Topics covered include research design issues preliminary data screening identification and description of cycles summary of results across time series and assessment of relations between time series Also considered are theoretical questions problems of interpretation and potential sources of artifact **Spectral Analysis and Time Series, Two-Volume Set** M. Koopmans, 1995-05-18 To tailor time series models to a particular physical problem and to follow the working of various techniques for processing and analyzing data one must understand the basic theory of spectral frequency domain analysis of time series This classic book provides an introduction to the techniques and theories of spectral analysis of time series In a discursive style and with minimal dependence on mathematics the book presents the geometric structure of spectral analysis This approach makes possible useful intuitive interpretations of important time series parameters and provides a unified framework for an otherwise scattered collection of seemingly isolated results The books strength lies in its applicability to the needs of readers from many disciplines with varying backgrounds in mathematics It provides a solid foundation in spectral analysis for fields that include statistics signal process engineering economics geophysics physics and geology Appendices provide details and proofs for those who are advanced in math Theories are followed by examples and

applications over a wide range of topics such as meteorology seismology and telecommunications Topics covered include Hilbert spaces univariate models for spectral analysis multivariate spectral models sampling aliasing and discrete time models real time filtering digital filters linear filters distribution theory sampling properties of spectral estimates and linear prediction Hilbert spaces univariate models for spectral analysis multivariate spectral models sampling aliasing and discrete time models real time filtering digital filters linear filters distribution theory sampling properties of spectral estimates linear prediction

(PSME-1) Clive William John Granger, Michio Hatanaka, 2015-12-08 The important data of economics are in the form of time series therefore the statistical methods used will have to be those designed for time series data New methods for analyzing series containing no trends have been developed by communication engineering and much recent research has been devoted to adapting and extending these methods so that they will be suitable for use with economic series This book presents the important results of this research and further advances the application of the recently developed Theory of Spectra to economics In particular Professor Hatanaka demonstrates the new technique in treating two problems business cycle indicators and the acceleration principle existing in department store data Originally published in 1964 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905
