Heinrich Bauer

The Of The Violin:

The Violin Explained James Beament, Sir James Beament, 2000 a comprehensive look at what is known about the mechanics of the violin family In a very readable and non mathematical style he explains the nature of sound production and confronts the question of tone assessment Professor Beament's book is a refreshing read full of information which goes a long way to filling a distinct gap in the market The Strad Throughout its history the violin has had a mystique with many curious beliefs This book now available in paperback offers an explanation without assuming any scientific background of how a violin produces sound and of how that sound causes what we hear This explodes many of the long standing myths It also shows there is no place for modern technology in making or playing Practical advice for players and parents is included

The Physics of the Violin Lothar Cremer, 1984-11-14 This major work covers almost all that has been learned about the acoustics of stringed instruments from Helmholtz's 19th century theoretical elaborations to recent electroacoustic and holographic measurements Many of the results presented here were uncovered by the author himself and by his associates

and students over a 20 year period of research on the physics of instruments in the violin family Lothar Cremer is one of the world's most respected authorities on architectural acoustics and not incidentally an avid avocational violinist and violist The book which was published in German in 1981 first of all meets the rigorous technical standards of specialists in musical acoustics But it also serves the needs and interests of two broader groups makers and players of stringed instruments are expressly addressed since the implications of the mathematical formulations are fully outlined and explained and acousticians in general will find that the work represents a textbook illustration of the application of fundamental principles and up to date techniques to a specific problem The first and longest of the book's three parts investigates the oscillatory responses of bowed and plucked strings The natural nonlinearities that derive from considerations of string torsion and bending stiffness are deftly handled and concisely modeled The second part deals with the body of the instrument Special attention is given to the bridge which transmits the oscillations of the strings to the wooden body and its air cavity In this case linear modeling proves serviceable for the most part a simplification that would not be possible with lute like instruments such as the guitar The radiation of sound from the body into the listener's space which is treated as an extension of the instrument itself is the subject of the book's final part
