Structure-Borne Sound L. Cremer, M. Heckl, 2013-03-09 Since structure borne sound plays an important role in noise control material testing and machine diagnosis the relevant properties of the most important elements of a construction plates beams and shells are investigated Measurement techniques equations of motion formulas for wave speeds resonance frequencies impedances transmission coefficients etc are given The different damping mechanisms and the radiation properties are treated The statistical energy analysis SEA is also presented This new edition has been enlarged to include also waves on orthotropic plates and the vibration and radiation of cylindrical shells Structure-Borne Sound L. Cremer, M. Heckl, Björn A.T. Petersson, 2005-12-05 Structure Borne Sound is a thorough introduction to structural vibrations with emphasis on audio frequencies and the associated radiation of sound The book presents in depth discussions of fundamental principles and basic problems in order to enable the reader to understand and solve his own problems It includes chapters dealing with measurement and generation of vibrations and sound various types of structural wave motion structural damping and its effects impedances and vibration responses of the important types of structures as well as with attenuation of vibrations and sound radiation from structures For the third edition the author fundamentally revised and newly organized the contents of the work Nevertheless the intention has been to preserve the style of the previous editions namely to focus on the fundamentals enabling the reader to analyse further problems **Structure-Borne Sound** L. Cremer, 1973 **Structure-Borne Sound** Lothar Cremer, Manfred Heckl, 2013-06-29 When the original German edition of this book first appeared in print the undersigned was asked to review it for an English language journal In the course of this review process he was so struck by the book's unusual approach as well as by the realization that no similar collection of information was available in English that he conceived the idea of undertaking this translation Arrangements with the original authors and with the publisher were completed late in 1969 the translation task was begun at that time and occupied nearly two and one half years largely because the undersigned's other professional activities permitted him to devote only his spare time to the translation effort Because this passage of time also brought with it some advances in the state of the art an attempt was made to include the most significant of these advances as well as newer references and some minor corrections in the translated version Except for these changes which were made with the enthusiastic endorsement and collaboration of the original authors the

translated version remains very close to the original. In fact the translator took special care to preserve not only the meaning but also the flavor of the original text. The translator is most grateful to Professor L. Cremer and Dr. *Structure - Borne Sound* Lothar Cremer, 2005

Large structures such as factories, gymnasia, concert halls, bridges, towers, masts, and chimneys can be detrimentally affected by vibrations. These vibrations can cause either serviceability problems severely hampering the user's comfort or safety problems. The aim of this book is to provide structural and civil engineers working in construction and environmental engineering with practical guidelines for counteracting vibration problems. Dynamic actions are considered from the following sources of vibration: human body motions, rotating, oscillating, and impacting machines, wind flow, road traffic, railway traffic, and construction work. The main section of the book presents tools that aid in decision making and in deriving simple solutions to cases of frequently occurring normal vibration problems. Complexer problems and more advanced solutions are also considered. In all cases these guidelines should enable the engineer to decide on appropriate solutions expeditiously. The appendices of the book contain fundamentals essential to the main chapters.

Structure-borne Sound Sources in Buildings Matthias Lievens, 2013

Structure-borne sound sources are vibrational sources connected in some way to the building structure. The mechanical excitation of the building structure leads to sound radiation. This is an important source of annoyance in modern light weight buildings. The prediction of the sound pressure level from structure-borne sound sources is highly complicated because of the complexity involved in the coupling between source and receiver structure. The current standard on characterisation of service equipment in buildings, EN 12354-5, can deal with sources on heavy structures, high mobility source, but to date there is no engineering method available for the case of coupling between source and receiver. A case study of a washing machine on a wooden joist floor is investigated in this thesis. In the first part measurements in the coupled state are conducted. It is shown that the normal components are sufficient to predict the sound pressure level. However, this only applies to the coupled state. In the second part a true prediction is calculated from independently measured source and receiver quantities. The difference between predicted and directly measured sound pressure level leads to considerable errors of up to 20 dB at low frequencies. This shows that the normal components are not sufficient to predict the coupling between a washing machine and a wooden floor.
