Michaelides,2008-02-27 Water cycling and the future availability of fresh water resources are immense societal concerns that impact all nations on Earth as it affects virtually every environmental issue Precipitation is also a fundamental component of the weather climate system for it regulates the global energy and radiation balance through coupling to clouds water vapor global winds and atmospheric transport Accurate and comprehensive information on precipitation is essential for understanding the global water energy cycle and for a wide range of research and applications with practical benefits to society However rainfall is difficult to measure because precipitation systems tend to be random in character and also evolve and dissipate very rapidly It is not uncommon to see a wide range of rain amounts over a small area and in any given area the amount of rain can vary significantly over a short time span These factors together make precipitation difficult to quantify yet measurements at such local scales are needed for many hydrometeorological applications such as flood and landslide forecasting Historical multi decadal measurements of precipitation from surface based rain gauges are available over continents but oceans remained largely unobserved prior to the beginning of the satellite era Early visible and infrared satellites provided information on cloud tops and their horizontal extent however wide band microwave frequencies proved extremely useful for probing into the precipitating liquid and ice layers of clouds On Requirements for a Satellite Mission to Measure Tropical Rainfall Otto W. Techniques for Measuring Liquid Water Content Along a Trajectory Rosemary M. Dyer,1981 The standard procedure for estimating the point value of liquid water content M along the reentry path of a ballistic missile is to use a radar derived value of radar reflectivity factor Z with the M to Z relation obtained from aircraft measurements of the particle spectrum This report contains descriptions of the various techniques used to make the radar and aircraft data compatible The results of various methods to predict the liquid water content values are compared with aircraft measured values The extrapolation of instrumentally truncated aircraft measurements to include the entire range of particle sizes is treated in Section 1 Section 2 contains a discussion of the method of deriving nominal M Z relations applies the method to data acquired at Kwajalein Missile Range and provides M Z relations for rain small snow large snow and bullet rosettes The introduction of the factor k to convert from aircraft measurements to radar derived values is also discussed in Section 2 The relationship of k with altitude and temperature for data from Kwajalein and Wallops Island is covered in Section 3 Finally Section 4 contains a determination of the accuracy to which liquid water content can be estimated from climatological storm data for moderate to heavy stratiform winter storms at Wallops Island The results of Section 4 demonstrate that situations which deviate significantly from climatological averages still require time specific M Z relations derived from simultaneous aircraft radar measurements
