Linguistic Evolution through Language Acquisition Ted Briscoe, 2002-08-08 This is a study of how children acquire

language and how this affects language change over generations Written by an international team of experts the volume proceeds from the basis that we can not only address the language faculty per se within the framework of evolutionary theory but also the origins and subsequent development of languages themselves languages evolve via cultural rather than biological transmission on a historical rather than genetic timescale The book is distinctive in utilizing computational simulation and modelling to help ensure the theories constructed are complete and precise Drawing on a wide range of examples the book covers the why and how of specific syntactic universals the nature of syntactic change the language learning mechanisms required to acquire an existing linguistic system accurately and to impose further structure on an emerging system and the evolution of language s in relation to this learning mechanism **Consciousness and Meaning**

Brian Loar,2017 One of the most important problems of modern philosophy concerns the place of subjectivity in a purely physical universe Brian Loar was a major contributor to the discussion of this problem for over four decades This volume brings together his most important and influential essays in the philosophy of language and of mind Handbook of

Management Communication François Cooren,Peter Stücheli-Herlach,2021-08-23 Management communication encompasses a wide range of practices that define modern organizations Those practices are in many respects constituted formed and contextualized by the use of language This handbook traces the theoretical modelling of these practices by contemporary research It explores their linguistic features and performance in specific situations of value creation and in various modes It is a companion for students and scholars of applied linguistics and organizational communication as well as management and strategy research **Local Structure Tensor for Multidimensional Signal Processing** Raúl San José Estépar,2007

Feature extraction and particularly orientation estimation of multidimensional images is of paramount importance for the Image Processing and Computer Vision communities This dissertation focuses on this topic specifically we deal with the problem of local structure tensor LST estimation as a mean of characterizing the local behavior of a multidimensional signal The LST can be seen as a measure of the uncertainty of a multidimensional signal with respect to a given orientation LST estimation can be achieved by estimating the local energy of a signal in different orientations Then the LST is computed as a linear combination of the local energy for each orientation with a tensor basis whose elements are calculated for each orientation This kind of methods for the estimation of the LST are based on quadrature filters to obtain the local energy of the signal While the LST based on quadrature filters is well defined for signals that vary locally only in one orientation simple signals the estimation method fails with complex signals i e signals that consist of several differently oriented simple signals In this dissertation an analytical study of the distortions of the tensor eigenvalues due to such complex neighborhoods is carried out From this analytical study two constructive methods are proposed for the estimation of the LST The first method is based on a maximum likelihood estimation of the quadrature filter outputs The second method uses a measure of phase consistency based on generalized quadrature filters which are formally derived from an extension of the analytic signal to

multidimensional signals known as the monogenic signal The interpretation of a multidimensional image as a function graph is a Riemannian manifold instead of just intensity variations on the Euclidean space has important implications that are exploited in this dissertation Image processing tasks can then be performed by solving partial differential equations on the Riemannian manifold In this dissertation Riemannian geometry is used to study the evolution of fronts under mean curvature flow on a Riemannian manifold using a level set framework For our purposes the Riemannian manifold is defined by the induced metric of the image that is related to the LST The Riemannian mean curvature flow is the theoretical basis for the definition of a level set segmentation method The methods proposed in this dissertation are applied to two medical image applications The first consists in a freehand 3D ultrasound reconstruction technique that uses the LST to perform an adaptive interpolation based on normalized convolution Our results show that our method outperforms traditional technique for this interpolation problem The second application uses the level set method based on Riemannian mean curvature flow to segment anatomical structures in dataset from magnetic resonance imaging MRI computed tomography CT and ultrasound US This novel method reveals as a feasible approach to medical image segmentation
