Relevance of Steroid Biosynthesis, Metabolism and Transport in Pathophysiology and Drug Discovery Tea Lanišnik Rižner, Walter Jäger, Csilla Özvegy-Laczka, 2019-07-10 Steroid hormones have important roles in human physiology but they are also implicated in the development of hormone dependent cancers and various non malignant diseases Furthermore changes in the concentrations of steroid hormones have important effects on the homeostasis of pre and post menopausal women as well as of men in andropause The associations of steroid hormones with pathophysiological processes and the altered mechanisms of their actions in disease are still not completely understood It has been known for more than thirty years that in addition to their endocrine activity steroid hormones act in an intracrine manner In target organs active androgens and estrogens can be formed from inactive or less active precursor steroid hormones mainly dehydroepiandrosterone sulfate DHEA S and estrone sulfate E1 S after their translocation into cells through the transporter proteins of the organic anion transporting polypeptide OATP and organic anion transporter OAT families The combination of altered uptake of precursors changed activation and action of estrogens and androgens in concert with the changes in the metabolism and excretion may thus have major roles in the development of hormone dependent malignant and non malignant diseases To date the salient roles of the individual players in disease pathophysiology have not been precisely defined The aim of this Research Topic is thus to highlight the progress made in the field of steroid transport and intracrine actions and metabolism with special emphasis on the involvement of these processes in the pathophysiology of hormone dependent disorders and on the identification of novel drug targets
