Large-Scale Structure of the Universe Kana Moriwaki, 2022-11-01 Line intensity mapping LIM is an observational technique that probes the large scale structure of the Universe by collecting light from a wide field of the sky This book demonstrates a novel analysis method for LIM using machine learning ML technologies The author develops a conditional

generative adversarial network that separates designated emission signals from sources at different epochs. It thus provides for the first time an efficient way to extract signals from LIM data with foreground noise. The method is complementary to conventional statistical methods such as cross correlation analysis. When applied to three dimensional LIM data with wavelength information, high reproducibility is achieved under realistic conditions. The book further investigates how the trained machine extracts the signals and discusses the limitation of the ML methods. Lastly, an application of the LIM data to a study of cosmic reionization is presented. This book benefits students and researchers who are interested in using machine learning to multi dimensional data not only in astronomy but also in general applications. *Beyond Λ CDM* Sownak Bose, 2018-08-02

This book employs computer simulations of artificial Universes to investigate the properties of two popular alternatives to the standard candidates for dark matter DM and dark energy DE. It confronts the predictions of theoretical models with observations using a sophisticated semi analytic model of galaxy formation. Understanding the nature of dark matter DM and dark energy DE are two of the most central problems in modern cosmology. While their important role in the evolution of the Universe has been well established, namely that DM serves as the building blocks of galaxies and that DE accelerates the expansion of the Universe, their true nature remains elusive. In the first half, the authors consider sterile neutrino DM motivated by recent claims that these particles may have finally been detected. Using sophisticated models of galaxy formation, the authors find that future observations of the high redshift Universe and faint dwarf galaxies in the Local Group can place strong constraints on the sterile neutrino scenario. In the second half, the authors propose and test novel numerical algorithms for simulating Universes with a modified theory of gravity as an alternative explanation to accelerated expansion. The authors' techniques improve the efficiency of these simulations by more than a factor of 20 compared to previous methods, inviting the readers into a new era for precision cosmological tests of gravity. **The Fast Forward MBA**

Building Galaxies: From The Primordial Universe To The Present, Procs Of The Xixth Rencontres De Moriond Veronique Cayatte, Bruno Guiderdoni, Francois Hammer, Trinh Xuan Thuan, J Tran Thanh Van, 2000-07-17 These proceedings provide a summary of the state of the art in the understanding of physical processes which control galaxy formation Many topics are discussed which present the latest observational results dust extinction the role of AGNs in the formation of massive galaxies etc How future instruments such as NGST ALMA FIRST KMT and SKAI can help to resolve these questions is also addressed The book will serve as a useful reference in the field for many years to come

A Statistical and Multi-wavelength Study of Star Formation in Galaxies Corentin Schreiber, 2016-09-12 This thesis presents a pioneering method for gleaning the maximum information from the deepest images of the far infrared universe obtained with the Herschel satellite reaching galaxies fainter by an order of magnitude than in previous studies Using these high quality measurements the author first demonstrates that the vast majority of galaxy star formation did not take place in merger driven starbursts over 90% of the history of the universe which suggests that galaxy growth is instead dominated by a steady infall of matter The author further demonstrates that massive galaxies suffer a gradual decline in their star formation activity providing an alternative path for galaxies to stop star formation One of the key unsolved questions in astrophysics is how galaxies acquired their mass in the course of cosmic time In the standard theory the merging of galaxies plays a major role in forming new stars Then old galaxies abruptly stop forming stars through an unknown process Investigating this theory requires an unbiased measure of the star formation intensity of galaxies which has been unavailable due to the dust obscuration of stellar light

First Stars III Brian W. O'Shea, Alexander Heger, Tom Abel, 2008-04-04 This conference explored the formation life and death of the earliest stars also known as Population III stars and their impact on subsequent structure formation and chemical evolution of the universe First Stars III covered a wide range of observational topics including star formation stellar evolution supernovae and the search for primordial and metal poor stars in the galactic halo

Particle Physics and Cosmology: Dark Matter M. Srednicki, 2012-12-02 At least eighty percent of the mass of the universe consists of some material which unlike ordinary matter neither emits nor absorbs light This book collects key papers related to the discovery of this astonishing fact and its profound implications for astrophysics cosmology and the physics of elementary particles The book focuses on the likely possibility that the dark matter is composed of an as yet undiscovered elementary particle and examines the boundaries of our present knowledge of the properties such a particle must possess

Planetary Ring Systems Matthew S. Tiscareno, Carl D. Murray, 2018-03-22 Planetary rings are among the most intriguing structures of our solar system and have fascinated generations of astronomers Collating emerging knowledge in the field this volume reviews our current understanding of ring systems with reference to the rings of Saturn Uranus Neptune and more Written by leading experts the history of ring research and the basics of ring particle orbits is followed by a review of the known planetary ring systems All aspects of ring system science are described in detail including specific dynamical processes types of structures thermal properties and their origins and investigations using computer simulations and laboratory experiments The concluding chapters discuss the prospects of future missions to planetary rings the ways in which ring science informs and is informed by the study of other astrophysical disks and a perspective on the field's future Researchers of all levels will benefit from this thorough and engaging presentation
