developments in science It is addressed principally to the student of human behavior as that study is approached from the social side Previously the study of human behavior was the general area of science that had been slowest to respond to the exciting challenge of the modern systems outlook Yet it is behavioral science that stands to gain the most from insights into the workings of more complex systems The editor presents not only a fair selection of systems research in behavioral science but also provides an extensive selection of important statements of general principles including several already considered classics Hence this sourcebook may function in part as a principles text exposing the initiate to original pioneering statements as well as later work inspired by them and alerting the sizeable number of underexposed scholars who are over familiar with the few terms such as feedback boundary input and output that there are much greater depths to plumb than meet the eye in semi popular accounts of cybernetics This volume is an overview of thinking that reflects a trend toward the system point of view Some of the chapters are philosophical they discuss the significance of the trend as a development in the contemporary philosophy of science Some are inevitably detailed and technical Still other chapters discuss the relevance of concepts that are central in the system approach to particular fields of research The picture that emerges is far from that of a unified theory It is an open question whether much progress can be made by attempts to construct a unified theory of systems on some rigorous axiomatic base

Principles of Quantitative Living Systems Science James R. Simms, 2005-12-02

In 1978 when the book *Living Systems* was published it contained the prediction that the sciences that were concerned with the biological and social sciences would in the future be stated as rigorously as the hard sciences that study such nonliving phenomena as temperature distance and the interaction of chemical elements *Principles of Quantitative Living Systems Science* the first of a planned series of three books begins an attempt to fulfill that prediction The view that living things are similar to other parts of the physical world differing only in their complexity was explicitly stated in the early years of the twentieth century by the biologist Ludwig von Bertalanffy His ideas could not be published until the end of the war in Europe in the 1940s Von Bertalanffy was strongly opposed to vitalism the theory current among biologists at the time that life could only be explained by recourse to a vital principle or God He considered living things to be a part of the natural order systems like atoms and molecules and planetary systems Systems were described as being made up of a number of interrelated and interdependent parts but because of the interrelations the total system became more than the sum of those parts These ideas led to the development of systems movements in both Europe and the United States that included not only biologists but scientists in other fields as well Systems societies were formed on both continents

A Living Systems Theory of Vocational Behavior and Development Fred W. Vondracek, Donald H. Ford, Erik J. Porfeli, 2014-07-03

The *Living Systems Theory of Vocational Behavior and Development* LSVD explains and illustrates the processes by which individuals construct their work experiences vocational pathways and career patterns through episodes of interaction with affordances they recognize within their contexts and how counseling can facilitate those processes The LSVD was created by combining the

scientifically based systems theory that explicates the dynamics of all aspects of human functioning and development called Humans as Self Constructing Living Systems with important ideas about vocational behavior and development The resulting integrative theory represents the individual person as a dynamic self directing and self constructing entity i e a living system Behavior Episodes BEs are the fundamental person in context dynamic units of analysis that serve as the building blocks by which individuals construct and retain their experiences in patterns that can be reactivated to facilitate future BEs The book describes how individuals history of satisfying BEs and their current activities provide the means by which vocational and career counselors can assist them to create satisfying vocational pathways It also describes for researchers how new non linear person centered quantitative and qualitative research methods can be used to analyze BE patterns to advance understanding of person level processes that play key roles in individuals vocational behavior and development The LSVD was designed to be not just an integrative framework for the field of career development but also to reconnect the field to related areas such as human resources and industrial organizational psychology and to the range of human sciences that have already embraced a living systems theoretical model

Representation and Behavior Fred Keijzer,2001-02-12 Keijzer provides a reconstruction of cognitive science s implicit representational explanation of behavior which he calls Agent Theory AT the use of mind as a subpersonal mechanism of behavior Representation is a fundamental concept within cognitive science Most often representations are interpreted as mental representations theoretical entities that are the bearers of meaning and the source of intentionality This approach views representation as the internal reflection of external circumstances that is as the end station of sensory processes that translate the environmental state of affairs into a set of mental representations Fred Keijzer stresses however that representations are also the starting point for a set of processes that lead back to the external environment They are used as theoretical components within an explanation of a person s outwardly visible behavior In this book Keijzer investigates the usefulness of representation for behavioral explanation irrespective of mental issues Viewing representation solely in terms of its contribution to explaining behavior allows him to build a serious case for a nonrepresentational approach and to evaluate representation s role in cognitive science Keijzer provides a reconstruction of cognitive science s implicit representational explanation of behavior which he calls Agent Theory AT AT is the use of mind as a subpersonal mechanism of behavior He proposes an alternative to AT called Behavioral Systems Theory BST which explains behavior as the result of interactions between an organism and its environment Keijzer compares BST to related work in the biology of cognition in the building of animal like robots and in dynamical systems theory Most important he extends BST to the difficult issue of anticipatory behavior through an analogy between behavior and morphogenesis the process by which a multicellular body develops
