Materials for a Healthy, Ecological and Sustainable Built Environment Emina K. Petrović, Brenda Vale, Maibritt Pedersen Zari, 2017-03-23 Principles for Evaluating Building Materials in Sustainable Construction Healthy and Sustainable Materials for the Built Environment provides a comprehensive overview of the issues associated with the selection of materials for sustainable construction proposing a holistic and integrated approach The book evaluates the issues involved in choosing materials from an ecosystem services perspective from the design stage to the impact of materials on the health of building users The three main sections of the book discuss building materials in relation to ecosystem services the implications of materials choice at the design stage and the impact of materials on building users and their health The final section focuses on specific case studies that illustrate the richness of solutions that existed before the rise of contemporary construction and that are consistent with a sustainable approach to creating built environments These are followed by modern examples which apply some if not all of the principles discussed in the first three sections of the book Provides a holistic and integrated approach to the issues associated with the selection of materials for sustainable construction Provides a thorough understanding of ecosystem services based on ecology research for built environment design Provides an original review of the impact of materials on human health Provides case studies to illustrate the points above

Building Ecology Peter Graham, 2009-02-12 Buildings consume 40% of our planet's materials and 30% of its energy Their construction uses up to three million tonnes of raw materials a year and generates 20% of the solid waste stream If we want to survive our urban future there is no option but to build in ways which improve the health of ecosystems Understanding the concept of ecological sustainability and translating it into practice as sustainable development is a key challenge for today's built environment professionals The skill and vision of those who shape our cities and homes is vital to achieving sustainable solutions to the many environmental economic and social problems we face on a local national and global scale Peter Graham offers here a holistic view of ecologically sustainable building by drawing on established areas of knowledge demonstrating their relevance to the environmentally conscious building professional and putting the process product and impact of building into context Case studies illustrate how sustainable principles have been applied successfully and discussion topics are offered to stimulate thought Building Ecology will help planners surveyors designers and builders to incorporate sustainability into their everyday practice by showing which styles of building are ecologically sustainable providing fundamental knowledge for making decisions using the principles of ecologically sustainable building explaining a complex subject in a clear balanced way Building Ecology sets out the current scientific view of how nature works and how

buildings link with and affect nature It provides fundamental knowledge for building in harmony with nature and keeping Earth's life supporting ecosystems healthy

Sustainable Built Environments Vivian Loftness, 2020-09-23 This volume in the Encyclopedia of Sustainability Science and Technology Second Edition describes the breadth of science and engineering knowledge critical to advancing sustainable built environments from architecture and design mechanical engineering lighting and materials to water and energy public policy and economics Covering both building landscape and green infrastructure design and management detailed consideration is given to how the building sector the biggest player in the energy use equation can minimize energy demand while providing measurable gains for productivity health and the environment With a focus on the environmental context the reader will understand how sustainable design merges the natural minimum resource conditioning solutions of the past daylight solar heat and natural ventilation with the innovative technologies including nature based solutions of the present The desired result is an integrated intelligent and as socially just as possible system that supports individual control with expert negotiation for resource consciousness

Building Materials for Sustainable and Ecological Environment Varenayam Achal, Chee Seong Chin, 2021-05-28 This book uses theories hypotheses policies practical insights and case studies to introduce and elucidate green building materials for sustainable construction Cement is the most widely used building material in construction however it is not sustainable being responsible for 7% of global carbon dioxide emissions and consuming huge quantities of energy In order to limit the ecological damage sustainable building materials are needed Ecosystems are a source of important lessons and models for transitioning the built environment onto a sustainable path that opens options for sustainable building material in construction The book provides a guide for readers seeking knowledge on sustainable building materials with the potential to lower environmental impact by reducing CO2 emission throughout the building's lifecycle The book is motivated by recent rapid advances in sustainable building materials production including green building materials made of industrial by products and recycled wastes earth materials plant based materials microbial based materials or supplementary cementitious materials to reduce the environmental impacts of traditional building materials Discussing the development and applications of various sustainable building materials including related case studies and addressing the environmental issue with a holistic and systematic approach that creates an ecology of construction for sustainability in infrastructures it offers promising solutions to achieve renewable and sustainable building materials for the future

Nature Based Strategies for Urban and Building Sustainability Gabriel Perez, Katia Perini, 2018-02-14 *Nature Based Strategies for Urban and Building Sustainability* reviews the current state of the art on the topic In the introduction the editors review the fundamental concepts of nature elements in the built environment along with the strategies that are necessary for their inclusion in buildings and cities Part One describes strategies for the urban environment discussing urban ecosystems and ecosystem services while Part Two covers strategies and technologies including vertical greening systems green roofs and green streets Part Three covers the

quantitative benefits results and issues and challenges including energy performances and outdoor comfort air quality improvement acoustic performance water management and biodiversity Provides an overview of the different strategies available to integrate nature in the built environment Presents the current state of technology concerning systems and methodologies on how to incorporate nature in buildings and cities Features the latest research results on operation and ecosystem services Covers both established and new designs including those still in the experimental stage

Construction Ecology Charles J. Kibert, Jan Sendzimir, G. Bradley Guy, 2003-08-27 Industrial ecology provides a sound means of systematising the various ideas which come under the banner of sustainable construction and provides a model for the design operation and ultimate disposal of buildings Climate Change Adaptation in the Built Environment Chamindi Malalgoda, Dilanthi Amaratunga, Richard Haigh, Shavindree Nissanka, Nishara Fernando, Ruben Paul Borg, Mo Hamza, 2025-05-02 Global climate change is one of the greatest environmental threats facing humanity and it is affecting every country on every continent Recent evidence confirms a close liaison between climate change induced hazards and the built environment as the built environment demonstrates a high fragility and vulnerability to hazardous situations The impact of climate change is particularly pertinent to the built environment given the life expectancy of buildings and the fact that it is essential to adapt the existing built environment to deal with a climate that may be significantly different from that in which it evolved Coastal regions are highly vulnerable to climate change because in addition to changes in temperature precipitation and more frequent flooding they will be affected by rising sea levels wave heights and accelerated coastal erosion The built environment exerts considerable influence over coastal communities local climate and environment Coastal areas also tend to be highly populated with many vulnerable urban centres located near the coastal belt In addressing such challenges it is important to better understand the impacts of climate change on the built environment and to develop tangible climate adaptation measures for the built environment **Technology, Design and Process Innovation in the Built Environment** Peter Newton, Keith Hampson, Robin Drogemuller, 2009-02-09 Buildings and infrastructure represent principal assets of any national economy as well as prime sources of environmental degradation Making them more sustainable represents a key challenge for the construction planning and design industries and governments at all levels and the rapid urbanisation of the 21st century has turned this into a global challenge This book embodies the results of a major research programme by members of the Australia Co operative Research Centre for Construction Innovation and its global partners presented for an international audience of construction researchers senior professionals and advanced students It covers four themes applied to regeneration as well as to new build and within the overall theme of Innovation Sustainable Materials and Manufactures focusing on building material products their manufacture and assembly and the reduction of their ecological fingerprints the extension of their service lives and their re use and recyclability It also explores the prospects for applying the principles of the assembly line Virtual Design Construction and Management viewed as increasing

sustainable development through automation enhanced collaboration such as virtual design teams real time BL performance assessment during design simulation of the construction process life cycle management of project information zero information loss risk minimisation and increased potential for innovation and value adding Integrating Design Construction and Facility Management over the Project Life Cycle by converging ICT design science engineering and sustainability science Integration across spatial scales enabling building infrastructure synergies such as water and energy efficiency Convergences between IT and design and operational processes are also viewed as a key platform increased sustainability
