Testing Of Metallic And Inorganic Coatings:

Testing of Metallic and Inorganic Coatings William B. Harding, 1987 Coatings are tested to confirm compliance with specifications to monitor the operation of a coating process and to evaluate coatings for various services The ability of a coating to perform as intended usually depends on several characteristics and the testing of a coating usually involves several different tests At first glance the nature of a characteristic that is being tested may seem clear and the results of a test may seem to be unambiguous however the nature of a characteristic may be more complex than realized and the ability of a test to measure the characteristic may be less than expected The members of the ASTM Committee B 8 on Metallic and Inorganic Coatings felt it was desirable to organize a symposium on the testing of the metallic and inorganic coatings so as to bring these problems to the attention of practitioners This publication is based on the symposium which was presented in Chicago on April 14 and 15 1986 *Methods for Corrosion Testing of Metallic and Other Inorganic Coatings on Metallic Substrates. Rating of Test Specimens and Manufactured Articles Subjected to Corrosion Tests* British Standards Institute Staff, 2001-05-15 Corrosion tests Physico chemical methods Corrosion resistance Metal coatings Protective coatings Non metallic coatings Coated materials Metals Ratings Test specimens Test equipment Decorative coatings Panels Corrosion environments Environmental testing Accelerated corrosion tests Accelerated testing Corrosion Testing of Materials with Metallic and Inorganic Coatings SW. Dean, 1987 Corrosion resistance is an important characteristic of many types of metallic and inorganic coating systems Corrosion resistance of coatings usually involves appearance maintenance as well as protection from structural damage Corrosion tests have been an important approach for evaluating the type and extent of damage that occurs to coated products Corrosion tests have been used both to assure the quality and performance of coated parts and to simulate the degree of degradation that occurs to components when exposed to specific atmospheric conditions for an extended time The standard tests that have been developed for both of these purposes are described and some of the problems with the testing approach are reviewed In particular the problem of simulating and accelerating atmospheric corrosion in a laboratory environment is highlighted Some of the newer approaches to corrosion testing using electrochemical techniques are discussed These approaches may have merit but many problems remain to be solved

Methods for Corrosion Testing of Metallic and Other Inorganic Coatings on Metallic Substrates - Rating of Test Specimens and Manufactured Articles Subjected to Corrosion Tests International Organization for Standardization, 1999 Corrosion Tests and Standards Robert Baboian, 2005 *Tribology and Mechanics of Magnetic Storage Devices* Bharat Bhushan, 2012-12-06 Magnetic recording is presently a 50 billion industry It spans audio video and digital applications in the form of tapes and disks The industry is expected to grow by a factor of five or more in the next decade This growth will be accompanied by dramatic improvements in the technology and the potential exists for magnetic recording densities to improve by at least one order of magnitude Magnetic recording process is accomplished by relative

motion between a magnetic head and a magnetic medium Types of magnetic media for digital recording are flexible media tapes and floppy disks and rigid disks Physical contact between head and medium occurs during starts and stops and hydrodynamic air film develops at high speeds Flying heights mean separation between head and medium are on the order of 0.1 micrometer comparable to surface roughness of the mating members Need for higher and higher recording densities requires that surfaces be as smooth as possible and flying heights be as low as possible Smoother surfaces lead to increased static kinetic friction and wear In the case of magnetic tapes in order to have high bit capacity for a given size of a spool we like to use as thin a tape substrate as possible Thinner tapes are prone to local or bulk viscoelastic deformation during storage This may lead to variations in head tape separations resulting in problems in data reliability
