Stellar Remnants:

Supernova Remnants and their X-Ray Emission John Danziger, Paul Gorenstein, 2012-12-06 IAU Symposium 101
Supernova Remnants and Their X ray Emission was held on the Island of San Giorgio Venice 30 August 2 September 1982 It was co sponsored by the National Research Council Italy the University of Padua the Observatory of Padua and the International Astronomical Union and was hosted by the Cini Foundation The contents of this volume show the wide range of disciplines that are involved in supernova remnant research Many new results were presented not only from the X ray observations from the Einstein Observatory but also from observations at optical and radio wavelengths This has led to the stimulation of theoretical work much of which attempts to accommodate in a more unified way all of these observations Research on supernova remnants of all ages was reported Perhaps the most impressive part of all this work is the way in which observations at all wavelengths have extended well outside the Galaxy to other members of the Local Group and beyond The Symposium was attended by scientists from 15 countries Twenty five invited papers and sixty eight shorter contributions were presented during the 4 day meeting Thirty three of these shorter contributions were presented in poster sessions This volume contains almost all 89 of those contributions They are followed by discussions which took place after each verbal presentation Since the availability of the discussions was left to the individual contributors they are not complete but those contained in this volume convey some idea of the nature of the exchanges **ESSCIRC '97** H. Modern Cosmological Observations and Problems Gregory Bothun, 2020-11-25 In recent years an enormous amount of cosmological data has come from well known projects such as the Hubble Space Telescope HST and the Cosmic Background Explorer COBE This book explains and makes sense of this vast array of new observational data in terms of its impact on current cosmological models With new theories and a plethora of data feeding cosmology in the 1990s Gregory Bothun sets about the task of re assessing our cosmological models He outlines exactly what the latest observations are and how they should be seen as either consistent or in conflict with current cosmogenic scenarios In this search for a reconciliation of current data with competing theory he explains how Einstein's idea of a cosmological constant has now become a viable hypothesis This authoritative text should be valuable to all those studying cosmological observations at advanced undergraduate or beginning graduate level Bothun draws a path through cosmology by defining a trajectory that is based on the data This should also provide a framework for professional cosmologists and related readers in physics as it presents a solid observational foundation which either supports or conflicts with present theory The book is illustrated including many CCD images of galaxies Given the rapidly changing nature of the field this book is supported by a World Wide Web site of supplementary material that is designed to readily update the material in the book **First Light in the Universe** Brigitte Rocca-Volmerange, 1993 *The Lords of the Stars* Pasquale De Marco, 2025-05-19 In the vast cosmic tapestry stars reign supreme their celestial dance shaping the fabric of our universe The Lords of the Stars embarks on an

Baryonic Dark Matter D. Lynden-Bell, Gerry Gilmore, 1990-03-31 The visible universe is a small perturbation on the material universe Zwicky and Sinclair Smith in the 1930s gave evidence of invisible mass in the Coma and Virgo Clusters of Galaxies Better optical data has only served to confound their critics and the X ray data confirms that the gravitational potentials are many times larger than those predicted on the basis of the observed stars Dynamical analyses of individual galaxies have found that significant extra mass is needed to explain their rotational velocities On much larger scales tens of megaparsecs there is suggestive evidence that there is even more mass per unit luminosity What is this non luminous stuff of which the universe is made How much of it is there Need there be only one kind of stuff There are three basic possibilities all of it is ordinary baryonic matter all of it is some other kind of non baryonic matter or some of it is baryonic and some is non baryonic
