Stellarator And Heliotron Devices:

Stellarator and Heliotron Devices Masahiro Wakatani, 1998 This monograph describes plasma physics for magnetic confinement of high temperature plasmas in nonaxisymmetric toroidal magnetic fields or stellarators The techniques are aimed at controlling nuclear fusion for continuous energy production While the focus is on the nonaxisymmetric toroidal field or heliotron developed at Kyoto University the physics applies equally to other stellarators and axisymmetric tokamaks The author covers all aspects of magnetic confinement formation of magnetic surfaces magnetohydrodynamic equilibrium and stability single charged particle confinement neoclassical transport and plasma heating He also reviews recent experiments and the prospects for the next generation of devices

Introduction to Stellarators Lise-Marie Imbert-Gérard, Elizabeth J. Paul, Adelle M. Wright, 2024-12-10 This self contained book is the first to provide readers with an introduction to the mathematical foundations of stellarator design and modeling It covers the fundamental theoretical building blocks of modeling magnetic fields some of the associated challenges and the main concepts behind optimization for the design of stellarators The book is divided into two parts with Part I providing a general introduction to the stellarator concept and Part II describing mathematical models and numerical methods commonly used in stellarator design The authors derive present and discuss relevant models using equations and figures to demonstrate the main ideas They carefully select language that is close to the plasma physics literature while providing enough details to be accessible to a reader without previous background in this field An Introduction to Stellarators From Magnetic Fields to Symmetries and Optimization is intended for mathematicians physicists and engineers interested in learning about stellarators Readers are expected to have a basic knowledge of classical physics partial differential equations and variational calculus but prior knowledge of plasma physics is not required

Turbulent Transport In Magnetized Plasmas (Second Edition) C Wendell Horton, Jr, 2017-07-21 For a few seconds with large machines scientists and engineers have now created the fusion power of the stars in the laboratory and at the same time find the rich range of complex turbulent electromagnetic waves that transport the plasma confinement systems The turbulent transport mechanisms created in the laboratory are explained in detail in the second edition of Turbulent Transport in Magnetized Plasmas by Professor Horton The principles and properties of the major plasma confinement machines are explored with basic physics to the extent currently understood For the observational laws that are not understood the empirical confinement laws offering challenges to the next generation of plasma students and researchers are explained in detail An example is the confinement regime called the I mode currently a hot topic is explored Numerous important problems and puzzles for the next generation of plasma scientists are explained There is growing demand for new simulation codes utilizing the massively parallel computers with MPI and GPU methods When the 20 billion dollar ITER machine is tested in the

2020ies new theories and faster smarter computer simulations running in near real time control systems will be used to control the burning hydrogen plasmas Systems Approaches to Nuclear Fusion Reactors Frederick B. Marcus, 2023-01-01 This book offers an overall review applying systems engineering and architecture approaches of the design optimization operation and results of leading fusion experiments These approaches provide a unified means of evaluating reactor design Methodologies are developed for more coherent construction or evaluation of fusion devices associated experiments and operating procedures The main focus is on tokamaks with almost all machines and their important results being integrated into a systems design space Case studies focus on DIII D TCV JET WEST the fusion reactor prototype ITER and the EU DEMO concept Stellarator Mirror and Laser inertial confinement experiments are similarly analysed including reactor implications of breakeven at NIF The book examines the engineering and physics design and optimization process for each machine analysing their performance and major results achieved thus establishing a basis for the improvement of future machines The reader will gain a broad historical and up to date perspective of the status of nuclear fusion research from both an engineering and physics point of view Explanations are given of the computational tools needed to design and operate successful experiments and reactor relevant machines This book is aimed at both graduate students and practitioners of nuclear fusion science and engineering as well as those specializing in other fields demanding large and integrated experimental equipment Systems engineers will obtain valuable insights into fusion applications References are given to associated complex mathematical derivations which are beyond the scope of this book The general reader interested in nuclear fusion will find here an accessible summary of the current state of nuclear fusion **Controlled Fusion and Plasma Physics** Kenro Miyamoto, 2006-10-23 Resulting from ongoing international research into fusion processes the International Tokamak Experimental Reactor ITER is a major step in the quest for a new energy source The first graduate level text to cover the details of ITER Controlled Fusion and Plasma Physics introduces various aspects and issues of recent fusion research activities through the shortest access path The distinguished author breaks down the topic by first dealing with fusion and then concentrating on the more complex subject of plasma physics The book begins with the basics of controlled fusion research followed by discussions on tokamaks reversed field pinch RFP stellarators and mirrors The text then explores ideal magnetohydrodynamic MHD instabilities resistive instabilities neoclassical tearing mode resistive wall mode the Boltzmann equation the Vlasov equation and Landau damping After covering dielectric tensors of cold and hot plasmas the author discusses the physical mechanisms of wave heating and noninductive current drive The book concludes with an examination of the challenging issues of plasma transport by turbulence such as magnetic fluctuation and zonal flow Controlled Fusion and Plasma Physics clearly and thoroughly promotes intuitive understanding of the developments of the principal fusion programs and the relevant fundamental and advanced plasma physics associated with each program
