

PATTERNS OF EARTH AND SKY

One warm summer night, two sisters decided to camp in their backyard. As they laid there, they noticed the sky was full of stars, but the stars looked different than they had when they camped in the backyard this past spring. They wondered how this could be?

The Earth rotates on an axis and this causes nightly movement of the stars across the sky. Earth completes one rotation in 24 hours. Earth not only rotates, but it also revolves around the sun. It takes Earth about 365 days to orbit the sun. The position of Earth changes in relation to the location of the sun, and this creates different views of the night sky.

1. The earth rotates

a. once a day

b. once a month

c. once a year

d. the earth does not rotate

2. It can be inferred from the model that night time is on side A / B (circle one) of the Earth.

As the sisters laid in the grass, they noticed the sky was full of stars. They observed that many stars could be seen, but none shine quite as bright and seem quite as large as the sun.

This is because the sun is the only star within our solar system. This large star is extremely bright and close to Earth. The other stars that are seen in the sky are located beyond our solar system.
