Abstract

All astronomical bodies originate inside clouds of gas and dust, therefore there should be a common process that leads to their condensation. In a galactic cloud there is always a gradient of speeds from point to point. Thanks to it, vortices originate that take the material of the surrounding cloud gradually forming large gaseous disks, inside which vortices of second order develop that concentrate the matter of their orbits forming smaller and much denser disks, within which third order vortices further concentrate the matter. The dense cores of these vortices finally condense in massive bodies: sun, planets and satellites. The result should be a well ordered planetary system with no "detritus" around and where both planets and satellites obey to a precise rule of the distances from their central body. The solar system complies with these conditions with three main exceptions. First, in an orbit where a large planet should be there is only a huge number of scattered asteroids. Second, Earth and its moon with all evidence were not formed in the same vortex, which means that Moon originated somewhere else. Third, Neptune's satellite system has been shattered by the intrusion of a foreign body, Triton, and its largest satellites are moving. These exceptions seem to be strictly connected to each other and all due to a unique event, that is: Triton has diverted the largest Neptune satellite towards the sun. This satellite impacted at high speed against the moving planet, scattering myriads of fragments from its mantle and pushing it towards the sun, where it eventually fell. The planet had at least 4 satellites some of which remained in their previous orbit, but two of them were dragged towards the sun and were captured by Earth. The largest became its lonely moon while the second fell on its surface giving origin to the continents. This event happened about 3.56 billion of years ago, as it is proved by the ages of the numerous samples brought from the moon.

Keywords: Galactic Cloud, Moon, Planetsimals, Satellites

Introduction

The current theory about the origin of our moon maintains that it was formed by material removed from Earth by a catastrophic impact with a foreign body. Not a very convincing hypothesis because, among other things, it assumes that our satellite was born as a result of an extraordinary and unrepeatable event not applicable to other similar satellites of the solar system [1].

No more convincing are the theories about the origin of the other satellites and even less those about the formation of the planets and the stars [2-4]. For each of them, in fact, different explanations are provided, which seems unlikely. All astronomical bodies, in the end, originate from clouds of gas and dust. The process that leads to their condensation within these clouds should be the same regardless of their size.
