Spectral And Scattering Theory:

Spectral and Scattering Theory for Ordinary Differential Equations Christer Bennewitz,Malcolm Brown,Rudi Weikard,2020-10-27 This graduate textbook offers an introduction to the spectral theory of ordinary differential equations focusing on Sturm Liouville equations Sturm Liouville theory has applications in partial differential equations and mathematical physics Examples include classical PDEs such as the heat and wave equations Written by leading experts this book provides a modern systematic treatment of the theory The main topics are the spectral theory and eigenfunction expansions for Sturm Liouville equations as well as scattering theory and inverse spectral theory It is the first book offering a complete account of the left definite theory for Sturm Liouville equations The modest prerequisites for this book are basic one variable real analysis linear algebra as well as an introductory course in complex analysis More advanced background required in some parts of the book is completely covered in the appendices With exercises in each chapter the book is suitable for advanced undergraduate and graduate courses either as an introduction to spectral theory in Hilbert space or to the spectral theory of ordinary differential equations Advanced topics such as the left definite theory and the Camassa Holm equation as well as bibliographical notes make the book a valuable reference for experts **Inverse Spectral and Scattering Theory** Hiroshi Isozaki,2020-09-26 The aim of this book is to provide basic knowledge of the inverse problems arising in various areas in mathematics physics engineering and medical science These practical problems boil down to the mathematical question in which one tries to recover the operator coefficients or the domain manifolds from spectral data The characteristic properties of the operators in question are often reduced to those of Schr dinger operators We start from the 1 dimensional theory to observe the main features of inverse spectral problems and then proceed to multi dimensions The first milestone is the Borg Levinson theorem in the inverse Dirichlet problem in a bounded domain elucidating basic motivation of the inverse problem as well as the difference between 1 dimension and multi dimension The main theme is the inverse scattering in which the spectral data is Heisenberg s S matrix defined through the observation of the asymptotic behavior at infinity of solutions Significant progress has been made in the past 30 years by using the Faddeev Green function or the complex geometrical optics solution by Sylvester and Uhlmann which made it possible to reconstruct the potential from the S matrix of one fixed energy One can also prove the equivalence of the knowledge of S matrix and that of the Dirichlet to Neumann map for boundary value problems in bounded domains We apply this idea also to the Dirac equation the Maxwell equation and discrete Schr dinger operators on perturbed lattices Our final topic is the boundary control method introduced by Belishev and Kurylev which is for the moment the only systematic method for the reconstruction of the Riemannian metric from the boundary observation which we apply to the inverse scattering on non compact manifolds We stress that this book focuses on the lucid exposition of these problems and mathematical backgrounds by explaining the basic knowledge of functional analysis and spectral theory omitting the technical details in order to make the book accessible to graduate
