Spectroscopy In The Biomedical Science:

Spectroscopy in the Biomedical Sciences R.M. Gendreau, 2018-01-18 The intent of this book a collection of manuscripts is to provide general descriptions of analytical techniques which we believe to be useful to the biological scientist and to provide examples of the utility of each technique The contributing authors were asked to focus on examples in which their particular technique has proven particularly useful in studies of biological systems Many commonly used analytical techniques such as NMR and ESR are not included in this work it is preferred to focus on techniques which perhaps have not received as much coverage as in the recent literature All of the analytical tools covered in this volume have great utility and the scientific community can expect to see increasing usage of most if not all of these techniques

Learning from Nature How to Design New Implantable Biomaterials: From Biomineralization Fundamentals to Biomimetic Materials and Processing Routes Rui L. Reis,S. Weiner,2005-12-29 The development of materials for any

replacement or regeneration application should be based on the thorough understanding of the structure to be substituted. This is true in many fields but particularly exigent in substitution and regeneration medicine. The demands upon the material properties largely depend on the site of application and the function it has to restore. Ideally a replacement material should mimic the living tissue from a mechanical, chemical, biological, and functional point of view. Of course this is much easier to write down than to implement in clinical practice. Mineralized tissues such as bones, tooth, and shells have attracted in the last few years considerable interest as natural anisotropic composite structures with adequate mechanical properties. In fact Nature is and will continue to be the best materials scientist ever. Who better than nature can design complex structures and control the intricate phenomena processing routes that lead to the final shape and structure from the macro to the nano level of living creatures? Who can combine biological and physico-chemical mechanisms in such a way that can build ideal structure-properties relationships? Who else than Nature can really design smart structural components that respond in situ to exterior stimulus being able of adapting constantly their microstructure and correspondent properties? In the described philosophy line mineralized tissues and biomineralization processes are ideal examples to learn from for the materials scientist of the future.
