*Geometric Probability* Herbert Solomon, 1978-01-01 Topics include ways modern statistical procedures can yield estimates of  $\pi$  more precisely than the original Buffon procedure traditionally used the question of density and measure for random geometric elements that leave probability and expectation statements invariant under translation and rotation the number of random line intersections in a plane and their angles of intersection developments due to W L Stevens s ingenious solution for evaluating the probability that  $n$  random arcs of size  $a$  cover a unit circumference completely the development of M W Crofton s mean value theorem and its applications in classical problems and an interesting problem in geometrical probability presented by a karyograph      Methods for Solving Systems of Nonlinear Equations Werner C. Rheinboldt, 1998-01-01 This volume discusses the ideas behind non linear equations as well as their theoretical foundations and properties      Variational Methods for Eigenvalue Approximation H. F. Weinberger, 1974-01-01 Provides a common setting for various methods of bounding the eigenvalues of a self adjoint linear operator and emphasizes their relationships A mapping principle is presented to connect many of the methods The eigenvalue problems studied are linear and linearization is shown to give important information about nonlinear problems Linear vector spaces and their properties are used to uniformly describe the eigenvalue problems presented that involve matrices ordinary or partial differential operators and integro differential operators      **Random Number Generation and Quasi-Monte Carlo Methods** Harald Niederreiter, 1992-01-01 This volume contains recent work in uniform pseudorandom number generation and quasi Monte Carlo methods and stresses the interplay between them      The Linear Sampling Method in Inverse Electromagnetic Scattering Fioralba Cakoni, David Colton, Peter Monk, 2011-01-13 A complete description of the linear sampling method for electromagnetic waves important for those researching inverse electromagnetic scattering theory      **Probability Theory and Combinatorial Optimization** J. Michael Steele, 1997-01-01 An introduction to the state of the art of the probability theory most applicable to combinatorial optimization The questions that receive the most attention are those that deal with discrete optimization problems for points in Euclidean space such as the minimum spanning tree the traveling salesman tour and minimal length matchings      Numerical Analysis of Spectral Methods David Gottlieb, Steven A. Orszag, 1977-01-01 A unified discussion of the formulation and analysis of special methods of mixed initial boundary value problems The focus is on the development of a new mathematical theory that explains why and how well spectral methods work Included are interesting extensions of the classical numerical analysis      **Variational Methods for the Numerical Solution of Nonlinear Elliptic Problem** Roland Glowinski, 2015-11-04 Variational Methods for the Numerical Solution of Nonlinear Elliptic Problems addresses computational methods that have proven efficient for the solution of a large variety of nonlinear elliptic problems These methods can be applied to many problems in science and engineering but this book focuses on their application to problems in continuum mechanics and physics This book differs from others on the topic by presenting examples of the power and versatility of operator splitting methods providing a detailed introduction to alternating direction

methods of multipliers and their applicability to the solution of nonlinear possibly nonsmooth problems from science and engineering and showing that nonlinear least squares methods combined with operator splitting and conjugate gradient algorithms provide efficient tools for the solution of highly nonlinear problems The book provides useful insights suitable for advanced graduate students faculty and researchers in applied and computational mathematics as well as research engineers mathematical physicists and systems engineers

**A Unified Approach to Boundary Value Problems** Athanassios S. Fokas, 2008-11-06 A novel approach to analysing initial boundary value problems for integrable partial differential equations PDEs in two dimensions based on ideas of the inverse scattering transform that the author introduced in 1997 This method is unique in also yielding novel integral representations for linear PDEs Several new developments are addressed in the book including a new transform method for linear evolution equations on the half line and on the finite interval analytical inversion of certain integrals such as the attenuated Radon transform and the Dirichlet to Neumann map for a moving boundary integral representations for linear boundary value problems analytical and numerical methods for elliptic PDEs in a convex polygon and integrable nonlinear PDEs An epilogue provides a list of problems on which the author's new approach has been used offers open problems and gives a glimpse into how the method might be applied to problems in three dimensions

**Mathematical Principles of Optical Fiber Communication** J. K. Shaw, 2004-05-01 This book is intended to support and promote interdisciplinary research in optical fiber communications by providing essential background in both the physical and mathematical principles of the discipline It is written to be as independent as possible while taking the reader to the frontiers of research on fiber optics communications

**Data Structures and Network Algorithms** Robert Endre Tarjan, 1983-01-01 This book attempts to provide the reader with a practical understanding and appreciation of the field of graph algorithms

*An Introduction to Structured Population Dynamics* J. M. Cushing, 1998-01-01 Interest in the temporal fluctuations of biological populations can be traced to the dawn of civilization How can mathematics be used to gain an understanding of population dynamics This monograph introduces the theory of structured population dynamics and its applications focusing on the asymptotic dynamics of deterministic models This theory bridges the gap between the characteristics of individual organisms in a population and the dynamics of the total population as a whole In this monograph many applications that illustrate both the theory and a wide variety of biological issues are given along with an interdisciplinary case study that illustrates the connection of models with the data and the experimental documentation of model predictions The author also discusses the use of discrete and continuous models and presents a general modeling theory for structured population dynamics Cushing begins with an obvious point individuals in biological populations differ with regard to their physical and behavioral characteristics and therefore in the way they interact with their environment Studying this point effectively requires the use of structured models Specific examples cited throughout support the valuable use of structured models Included among these are important applications chosen to illustrate both the mathematical

theories and biological problems that have received attention in recent literature      **Topics in Finite Elasticity** Morton E. Gurtin, 1981-09-01 This monograph presents a derivation of the basic equations of the theory of finite elasticity      An Algorithmic Theory of Numbers, Graphs and Convexity Laszlo Lovasz, 1987-01-01 Studies two algorithms in detail the ellipsoid method and the simultaneous diophantine approximation method      **Integer Programming** Ellis L. Johnson, 1980-01-01 This monograph considers pure integer programming problems which concern packing partitioning or covering For this class of problems an algorithmic framework using a duality approach is offered Furthermore the author proposes for the first time a general framework for both packing and covering problems characterizing the convex whole of integer solutions      *Navier-Stokes Equations and Nonlinear Functional Analysis* Roger Temam, 1995-01-01 This second edition like the first attempts to arrive as simply as possible at some central problems in the Navier Stokes equations in the following areas existence uniqueness and regularity of solutions in space dimensions two and three large time behavior of solutions and attractors and numerical analysis of the Navier Stokes equations Since publication of the first edition of these lectures in 1983 there has been extensive research in the area of inertial manifolds for Navier Stokes equations These developments are addressed in a new section devoted entirely to inertial manifolds Inertial manifolds were first introduced under this name in 1985 and since then have been systematically studied for partial differential equations of the Navier Stokes type Inertial manifolds are a global version of central manifolds When they exist they encompass the complete dynamics of a system reducing the dynamics of an infinite system to that of a smooth finite dimensional one called the inertial system Although the theory of inertial manifolds for Navier Stokes equations is not complete at this time there is already a very interesting and significant set of results which deserves to be known in the hope that it will stimulate further research in this area These results are reported in this edition      Combinatorial Algorithms Herbert S. Wilf, 1989-01-01 Covers key recent advances in combinatorial algorithms
