

3 Stability

A boat is said to be stable if it tends to return to the upright position after being disturbed by external forces, such as waves, wind or movement of the crew.

The amount of energy trying to return the boat to the upright depends on three things:

- the mass of the boat
- the position of the centre of gravity (CG) of all the elements making up the boat and it's load (hull, masts, ballast, engines, fuel, stores, people, etc)
- the position of the centre of the volume of water displaced (CB) which depends on the shape of the immersed part of the hull. The CB will change with loading, heel angle and trim.

A boat may be stable when only heeled to small angles (say less than 30°) and unstable thereafter. The angle at which the boat will not return to the upright is called the Angle of Vanishing Stability.

The boat is stable if, as it heels, the CB moves to one side more rapidly than the CG.

See Annex A: More About Stability

What are the stability hazards?

A boat must have sufficient stability to resist the forces to which it will be subjected. If not it will **CAPSIZE**. Causes of capsize include:

excessive off-set load, e.g. crowding of people on board, heavy weights on one side

forces generated by waves, especially breaking waves

strong winds (particularly applies to sailing boats)

hydrodynamic effects (e.g. boat hull shape)

reduction in the original stability (e.g. extra weight added high up the structure)
