Stability And Ductility Of Steel Structures:

Stability and Ductility of Steel Structures T. Usami, Y. Itoh, 1998-07-23 The near field earthquake which struck the Hanshin Awaji area of Japan before dawn on January 17 1995 in addition to snatching away the lives of more than 6 000 people inflicted horrendous damage on the region's infrastructure including the transportation communication and lifeline supply network and of course on buildings too A year earlier the San Fernando Valley area of California had been hit by another near field quake the Northridge Earthquake which dealt a similarly destructive blow to local infrastructures Following these two disasters structural engineers and researchers around the world have been working vigorously to develop methods of design for the kind of structure that is capable of withstanding not only the far field tectonic earthquakes planned for hitherto but also the full impact of near field earthquake Of the observed types of earthquake damage to steel structures there are some whose causes are well understood but many others continue to present us with unresolved problems To overcome these it is now urgently necessary for specialists to come together and exchange information The contents of this volume are selected from the Nagoya Colloquium proceedings will become an important part of the world literature on structural stability and ductility and will prove a driving force in the development of future stability and ductility related research and design

Stability and Ductility of Steel Structures (SDSS'99) D. Dubin & M. Iványi, 1999-08-03 With the gradual development of rules for designing against instability the idea emerged in London in 1974 to hold an International Colloquium treating every aspect of structural instability of steel structures There have been 17 International Colloquia Stability Sessions around the world starting with the first one in Paris in 1972 until with the last one in Nagoya in 1997 In Nagoya it was decided to continue the series of travelling colloquia by launching the Sixth Colloquium in September 1999 with the First Session to be held at the Politehnica University of Timi oara Romania which will be followed by another in the year 2000 at the Gediminas Technical University in Vilnius Lithuania a third one during SSRC's Year 2000 Annual Meeting in the US and a fourth one in Australia or New Zealand At present important research projects are in progress around the world like SAC Joint Venture Project in USA INCO COPERNICUS RECOs in Europe and others which are devoted to improve and develop new methods for the safety design of steel structures in seismic zones Special attention is paid in Europe USA and Japan to improve the design codes and detailing of seismic resistant steel structures This was the reason to organise the Session of Nagoya as Stability and Ductility of Steel Structures Colloquium Romania is also a strong seismic territory and therefore the topic of the Timi oara Session covered both stability and ductility problems The technical programme of the SDSS 99 Colloquium in Timi oara has been split into nine working sessions
