**Model-Based Signal Processing** James V. Candy, 2005-10-13 A unique treatment of signal processing using a model based perspective Signal processing is primarily aimed at extracting useful information while rejecting the extraneous from noisy data If signal levels are high then basic techniques can be applied However low signal levels require using the underlying physics to correct the problem causing these low levels and extracting the desired information Model based signal processing incorporates the physical phenomena measurements and noise in the form of mathematical models to solve this problem Not only does the approach enable signal processors to work directly in terms of the problem s physics instrumentation and uncertainties but it provides far superior performance over the standard techniques Model based signal processing is both a modeler s as well as a signal processor s tool Model Based Signal Processing develops the model based approach in a unified manner and follows it through the text in the algorithms examples applications and case studies The approach coupled with the hierarchy of physics based models that the author develops including linear as well as nonlinear representations makes it a unique contribution to the field of signal processing The text includes parametric e g autoregressive or all pole sinusoidal wave based and state space models as some of the model sets with its focus on how they may be used to solve signal processing problems Special features are provided that assist readers in understanding the material and learning how to apply their new knowledge to solving real life problems Unified treatment of well known signal processing models including physics based model sets Simple applications demonstrate how the model based approach works while detailed case studies demonstrate problem solutions in their entirety from concept to model development through simulation application to real data and detailed performance analysis Summaries provided with each chapter ensure that readers understand the key points needed to move forward in the text as well as MATLAB r Notes that describe the key

commands and toolboxes readily available to perform the algorithms discussed. References lead to more in depth coverage of specialized topics. Problem sets test readers knowledge and help them put their new skills into practice. The author demonstrates how the basic idea of model based signal processing is a highly effective and natural way to solve both basic as well as complex processing problems. Designed as a graduate level text, this book is also essential reading for practicing signal processing professionals and scientists who will find the variety of case studies to be invaluable. An Instructor's Manual presenting detailed solutions to all the problems in the book is available from the Wiley editorial department.

**Bayesian Signal Processing** James V. Candy, 2016-06-20. Presents the Bayesian approach to statistical signal processing for a variety of useful model sets. This book aims to give readers a unified Bayesian treatment starting from the basics: Bayes's rule to the more advanced Monte Carlo sampling, evolving to the next generation model based techniques: sequential Monte Carlo sampling. This next edition incorporates a new chapter on Sequential Bayesian Detection, a new section on Ensemble Kalman Filters, as well as an expansion of Case Studies that detail Bayesian solutions for a variety of applications. These studies illustrate Bayesian approaches to real world problems incorporating detailed particle filter designs, adaptive particle filters, and sequential Bayesian detectors. In addition to these major developments, a variety of sections are expanded to fill in the gaps of the first edition. Here metrics for particle filter (PF) designs with emphasis on classical sanity testing lead to ensemble techniques as a basic requirement for performance analysis. The expansion of information theory metrics and their application to PF designs is fully developed and applied. These expansions of the book have been updated to provide a more cohesive discussion of Bayesian processing with examples and applications enabling the comprehension of alternative approaches to solving estimation/detection problems. The second edition of Bayesian Signal Processing features Classical Kalman filtering for linear, linearized, and nonlinear systems; modern unscented and ensemble Kalman filters; and the next generation Bayesian particle filters. Sequential Bayesian detection techniques incorporating model based schemes for a variety of real world problems. Practical Bayesian processor designs including comprehensive methods of performance analysis ranging from simple sanity testing and ensemble techniques to sophisticated information metrics. New case studies on adaptive particle filtering and sequential Bayesian detection are covered, detailing more Bayesian approaches to applied problem solving. MATLAB notes at the end of each chapter help readers solve complex problems using readily available software commands and point out other software packages available. Problem sets included to test readers knowledge and help them put their new skills into practice. Bayesian Signal Processing, Second Edition is written for all students, scientists, and engineers who investigate and apply signal processing to their everyday problems.

**Optimization, Control, and Automation** Kevin M. Passino, 2005-09-08 Biomimicry uses our scientific understanding of biological systems to exploit ideas from nature in order to construct some technology In this book we focus on how to use biomimicry of the functional operation of the hardware and software of biological systems for the development of optimization algorithms and feedback control systems that extend our capabilities to implement sophisticated levels of automation The primary focus is not on the modeling emulation or analysis of some biological system The focus is on using bio inspiration to inject new ideas techniques and perspective into the engineering of complex automation systems There are many biological processes that at some level of abstraction can be represented as optimization processes many of which have a

basic purpose automatic control decision making or automation For instance at the level of everyday experience we can view the actions of a human operator of some process e g the driver of a car as being a series of the best choices he or she makes in trying to achieve some goal staying on the road emulation of this decision making process amounts to modeling a type of biological optimization and decision making process and implementation of the resulting algorithm results in human mimicry for automation There are clearer examples of biological optimization processes that are used for control and automation when you consider nonhuman biological or behavioral processes or the internal biology of the human and not the resulting external behavioral characteristics like driving a car For instance there are homeostasis processes where for instance temperature is regulated in the human body
