

# VISCOUS AND INVISCID STABILITY OF MULTIDIMENSIONAL PLANAR SHOCK FRONTS

K. ZUMBRUN AND D. SERRE

January 13, 1999; Revised: March 11, 1999.

**ABSTRACT.** We explore the relation between viscous and inviscid stability of multidimensional shock fronts, by studying the Evans function associated with the viscous shock profile. Our main result, generalizing earlier one-dimensional calculations, is that the Evans function reduces in the long-wave limit to the Kreiss-Sakamoto-Lopatinski determinant obtained by Majda in the inviscid case, multiplied by a constant measuring transversality of the shock connection in the underlying (viscous) traveling wave ODE. Remarkably, this result holds independently of the nature of the viscous regularization, or the type of the shock connection. Indeed, the analysis is more general still: in the overcompressive case, we obtain a simple long-wave stability criterion even in the absence of a sensible inviscid problem.

An immediate consequence is that inviscid stability is necessary (but not sufficient) for viscous stability; this yields a number of interesting results on viscous instability through the inviscid analyses of Erpenbeck, Majda, and others. Moreover, in the viscous case, the Kreiss-Sakamoto-Lopatinski determinant is seen to play the key role of a "generalized Fredholm solvability condition," determining the spectral expansion about zero of the linearized operator about the wave, and thereby the transverse propagation of signals along the front. This expansion is in general not analytic, due to accumulation of essential spectrum, but rather has conical structure. A consequence, as in the inviscid case, is that stability is typically stronger for systems than for scalar equations. In the indeterminate, "tangent" case (Majda's "weak stability"), we provide an appropriate higher order correction.

## §1. Introduction

Consider a system of viscous conservation laws,

$$(1.1) \quad u_t + \sum_j f^j(u)_{x_j} = \sum_{j,k} (B^{jk}(u)u_{x_k})_{x_j},$$

$u, f^j \in \mathbb{R}^n$ ,  $B \in \mathbb{R}^{n \times n}$ ,  $x \in \mathbb{R}^d$ , and a planar shock solution

$$(1.2) \quad u(x, t) = \bar{u}(x_1 - st), \quad \lim_{z \rightarrow \pm\infty} \bar{u}(z) = u_{\pm}.$$

*Analytical Approaches to Multidimensional Balance Laws* Olga S. Rozanova, 2006 It is difficult to overestimate the importance of mathematical investigation of balance laws They arise in many areas of physics mechanics chemistry biology social sciences In this collective book we concentrate in particular on the equations of continuous medium and related to them As a rule they are very complicated in their primitive form An important feature of such equations is a possible formation of singularities even in initially smooth solution within a finite time The structure of the singularities can be very complex A natural step in the approach to this problem is the transition despite the three dimensionality of our world to spatially one dimensional model Significant progress has been achieved in this direction Unfortunately the methods of the one dimensional theory as usual cannot be adapted to a case of many spatial variables However there are many attempts to deal with multidimensional problems We would like to present some of them All of the papers are written by outstanding experts representing various schools in mathematics and mechanics Each paper is organised as follows it contains an elementary as far as it is possible introduction to a problem a brief review of previously published results and then original results of the authors are presented Multi-dimensional Shock Front for Transonic Flow Equations Enrique Alberto

Thomann, 1985 Advances in the Theory of Shock Waves Heinrich Freistühler, Anders Szepessy, 2012-12-06 In the field known as the mathematical theory of shock waves very exciting and unexpected developments have occurred in the last few years Joel Smoller and Blake Temple have established classes of shock wave solutions to the Einstein Euler equations of general relativity indeed the mathematical and physical consequences of these examples constitute a whole new area of research The stability theory of viscous shock waves has received a new geometric perspective due to the work of Kevin Zumbrun and collaborators which offers a spectral approach to systems Due to the intersection of point and essential spectrum such an approach had for a long time seemed out of reach The stability problem for in viscid shock waves has been given a novel clear and concise treatment by Guy Metivier and coworkers through the use of paradifferential calculus The  $L^1$  semi group theory for systems of conservation laws itself still a recent development has been considerably condensed by the introduction of new distance functionals through Tai Ping Liu and collaborators these functionals compare solutions to different data by direct reference to their wave structure The fundamental properties of systems with relaxation have found a systematic description through the papers of Wen An Yong for shock waves this means a first general theorem on the existence of corresponding profiles The five articles of this book reflect the above developments **The Mathematics of**
