Power and Sample Size in R guides the reader through power and sample size calculations for a wide variety of study outcomes and designs and illustrates their implementation in R software. It is designed to be used as a learning tool for students as well as a resource for experienced statisticians and investigators. The book begins by explaining the process of power calculation step by step at an introductory level and then builds to increasingly complex and varied topics. For each type of study design, the information needed to perform a calculation and the factors that affect power are explained. Concepts are explained with statistical rigor but made accessible through intuition and examples. Practical advice for performing sample size and power calculations for real studies is given throughout. The book demonstrates calculations in R. It is integrated with the companion R package `powertools` and also draws on and summarizes the capabilities of other R packages. Only a basic proficiency in R is assumed. Topics include comparison of group means and proportions, ANOVA including multiple comparisons, power for confidence intervals, multistage designs, linear logistic and Poisson regression, crossover studies, multicenter cluster randomized and stepped wedge designs, and time to event outcomes. Chapters are also devoted to designing noninferiority, superiority by a margin, and equivalence studies and handling multiple primary endpoints. By emphasizing statistical thinking about the factors that influence power for different study designs and outcomes, as well as providing R code, this book equips the reader with the knowledge and tools to perform their own calculations with confidence. **Key Features:** Explains power and sample size calculation for a wide variety of study designs and outcomes.
