Wiring Principles of Cerebral Cortex Julian Budd, Zoltán F. Kisvárdy, 2015-11-17 Cerebral cortex is probably the most complex biological network Here many millions of individual neurons the functional units of cortex are interconnected through a massive yet highly organized pattern of axonal and dendritic wiring This wiring enables both near and distant cells to coordinate their responses and generate a rich variety of cognitions and behaviours When the wiring is damaged through disease or trauma it may reorganize but this may lead to characteristic pathological behaviours While there have been significant advances in mapping cortical connectivity the organizing principles and function of this connectivity are not well understood On the one hand there appears to be general

design constraints governing cortical wiring as first recognised by Ramón y Cajal's in his laws of conduction material and volume conservation. Yet on the other hand particular patterns of cortical wiring exist to serve specific functions. There is a wide gap in understanding how the response and connectivity properties of a single neuron contribute to emergent network functions such as in detecting perceptually relevant features. Unravelling this intimate causal relationship represents one of the major challenges in neuroscience. This Research Topic will examine progress in understanding cortical wiring principles. This Research Topic aims to draw together recent advances in methods and understanding as well as recent challenges to existing ideas about how cerebral cortex is wired. This is particularly timely because new automated techniques may soon yield huge datasets in need of explanation. Recent studies have for instance empirically evaluated Ramón y Cajal's conservation laws for cerebral cortex while others have shown some unexpected connectivity features that may refine the traditional view of how corticocortical connections are organised with regard to functional representations of auditory, somatosensory and visual cortices. Understanding these data will help improve the fidelity of neural models of cerebral cortical function and take into account the diversity of connections at both micro and mesoscopic scales not seen at such a depth before.

The Neuronal Functions of EF-hand Ca(2+)-binding Proteins 2nd Edition Michael R. Kreutz, José R. Naranjo, Karl-Wilhelm Koch, Beat Schwaller, 2016-11-01

Ca²⁺ signaling in neurons is characterized by highly restricted and dynamic gradients called Ca²⁺ waves, spikes, transients and puffs depending upon their corresponding spatial and temporal features. Based on this strict segmentation, the Ca²⁺ ion provides a versatile basis for complex signaling in neuronal subcompartments with a spatial resolution of micro and nanodomains. The multitude of Ca²⁺ regulated processes requires specialized downstream processing machinery translating the Ca²⁺ signal into alterations of cellular processes. The broad range of different Ca²⁺ triggered phenomena in neurons ranging from neurotransmission to gene expression is reflected by the existence of a multitude of different Ca²⁺ binding proteins, CaBPs, from which numerous belong to the EF hand superfamily. EF hand proteins can be subdivided into Ca²⁺ buffer and Ca²⁺ sensor proteins. Whereas the first group has a very high affinity for Ca²⁺, exhibits little conformational change in the Ca²⁺ bound state and is thought to mainly chelate Ca²⁺, the second group has a lower affinity for Ca²⁺ and shows considerable conformational changes upon Ca²⁺ binding which usually triggers a target interaction. Neuronal calcium sensor (NCS) proteins and the related caldendrin, CaBP, calneuron, nCaBPs proteins are members of this latter group. They resemble the structure of their common ancestor calmodulin (CaM) with four EF hand Ca²⁺ binding motifs of which not all are functional. However, despite their structural homology with CaM, NCS as well as nCaBPs are quite diverse in amino acid sequence. It is therefore surprising that relatively few binding partners have been identified that are not CaM targets and this raises the question of the specificity and function of these interactions. In terms of function, binding of NCS and nCaBP has frequently different consequences than binding of CaM which substantially increases the versatility of the Ca²⁺ tool kit. The general idea of this special issue is to provide an overview on the function of neuronal EF

hand calcium binding proteins in health and disease But we will not just provide a mere collection of articles to stress the function of each protein The issue will mainly deal with emerging concepts on Ca²⁺ signaling buffering mediated by EF hand Ca²⁺ binding proteins This includes questions like features that define the functional role of a EF hand calcium sensor in neurons the conditions that make physiological relevance of a given interaction of a CaBP with its target plausible the emerging synaptic role of these proteins and mounting evidence for their role in the regulation of protein trafficking Structural aspects and biophysical studies will be covered Another aspect will be the role of CaBPs in brain disease states This aspect includes studies showing that CaBPs are targets of drugs in clinical use studies showing that expression levels of calcium binding proteins are frequently altered in brain disease states as well as reports on mutations in EF hand calcium sensors linked to human disease
