Peripheral Auditory Mechanisms J.B. Allen, J.L. Hall, A. Hubbard, S.T. Neely, A. Tubis, 2013-06-29 How well can we model experimental observations of the peripheral auditory system What theoretical predictions can we make that might be tested It was with these questions in mind that we organized the 1985 Mechanics of Hearing Workshop to bring together auditory researchers to compare models with experimental observations The workshop forum was inspired by the very successful 1983 Mechanics of Hearing Workshop in Delft 1 Boston University was chosen as the site of our meeting because of the Boston area's role as a center for hearing research in this country We made a special effort at this meeting to attract students from around the world because without students this field will not progress Financial support for the workshop was provided in part by grant BNS 8412878 from the National

Science Foundation Modeling is a traditional strategy in science and plays an important role in the scientific method Models are the bridge between theory and experiment They test the assumptions made in experimental designs They are built on experimental results and they may be used to test hypotheses and predict experimental results The latter is the scientific method at its best Cochlear function is very complicated For this reason models play an important role One goal of modeling is to gain understanding but the necessary mathematical tools are often formidably complex An example of this is found in cochlear macromechanics *Acoustic Immittance Measures* Lisa L.
