ABSTRACT

Yunnan is exceedingly rich in higher fungi (Ascomycota and Basidiomycota). Given that the number of fungi (including lichens) occurring in a given area is, as Hawksworth suggested, roughly six times that of local vascular plants, a total of approximately 104,000 fungal species would be expected in Yunnan. However, to date only about 6000 fungal species, including roughly 3000 species of higher fungi, have been reported from the province. Although studies on Yunnan's fungi started in the late nineteenth century, significant progress has been made only in the last forty-five years. Over the first twenty-five years of this period, studies on fungal diversity in this area have largely been about taxonomy based on morphological characters and partially on geographical distribution. Over the past twenty years, the combination of both morphological and molecular phylogenetic approaches has become the preferred method to help understand the diversity and evolution of higher fungi. This review focuses on our current knowledge of how geological, geographical, and ecological factors may have contributed to the diversity patterns of higher fungi in Yunnan. Based on this knowledge, three aspects for future studies are suggested.

1. Introduction

Yunnan Province, located in southwestern China, covers a total area of 394,000 square kilometers, about 84% of which is mountainous. The highest point is located in the north with an elevation of 6740 m, while the lowest point is in the south with an elevation of only 76.4 m above sea level. The average altitude of the province, similar to central Yunnan, is around 2000 m (<http://www.web.yn.gov.cn/art/141-21>).

The complex topography and geography, highly variable climate, luxuriant vegetation, warm and wet currents from the Indian and Pacific Oceans in summer, and other abiotic and biotic factors, provided ample refuges during the Quaternary glaciations (Sun et al., 2017), and make Yunnan a favorable region for the

growth and reproduction of higher fungi. The extremely high fungal diversity in this area has attracted much attention from mycologists both at home and abroad.

Here we review studies of this area from the late 1880s to the present, based on which an up-to-date view is provided on the patterns of diversity of higher fungi in Yunnan and the mechanisms that drive that diversity, with a special emphasis on ecological, geographical and geological factors that may have influenced the diversity of local higher fungi.

2. Brief history of fungal diversity studies

As early as the Ming Dynasty, several ancient Chinese scholars, such as Lan Mao (1397–1476) and Li Shi-zhen (1518–1593), paid close attention to fungi for medical purposes. Records show that modern mycological research in China has a history of over 100 years (Zang and Li, 2008). Studies on higher fungi in Yunnan started at the end of the 19th century. Several western missionaries and explorers collected fungal specimens, together with plant and animal samples, from Yunnan for scientific studies. For example, J. M. Delavay made fungal collections from northwestern Yunnan in the
