Analysis of Electrically Small Antenna Designs and Limitations James C. Howell, 2018 Author's abstract Electronic sizes are constantly decreasing The need for smaller communication systems is at an all time high The antenna is a major part of wireless communication systems so the need for smaller antennas is also paramount Electrically small antennas are the solution to this problem Electrically small antennas have many inherent limitations In this thesis a comprehensive background on electrically small antennas is conducted to illustrate the common design limitations that face electrically small antennas Three novel size reduced antennas are presented in this thesis A 15 element size reduced Yagi Uda antenna a 6 element size reduced antenna and a spherical helix electrically small antenna are all introduced in this thesis The antennas are all designed simulated fabricated and measured for verification of results

[Analysis and Design of Electrically Small Antennas for Non-line-of-sight Communications](#) Sungkyun Lim, 2007 As the demand for compact portable communication electronics increases the technology of miniaturization has made great progress A beneficiary of that progress has been research into new concepts for the antenna one of the essential components in wireless communications As the size of an antenna becomes smaller however the antenna suffers from high Q and low radiation resistance The results are narrow bandwidth poor matching low efficiency and more generally poor performance throughout the communication system First the design of a small antenna for HF VHF communications is described As the operating frequency of an antenna decreases for example into the HF and low VHF regions the physical size of the antenna becomes a critical issue It is desirable to design a truly electrically small antenna by reducing the ground plane size Moreover when the antenna size is

very small the bandwidth of the antenna is extremely narrow which is critical to various deployment variances and propagation effects such as multi path fading The new design which is an inductively coupled top loaded monopole structure optimized by a genetic algorithm GA maximizes transmission of HF VHF waves Electrically small spiral ground planes for the monopole and the electrically small antenna are designed for HF ground wave transmission In addition a tunable small antenna is investigated that overcomes the narrow bandwidth limitation of electrically small antennas Second new design methodologies for electrically small antennas are discussed Use of an inductively coupled feed is one of the well known methods for boosting input resistance As the antenna size becomes smaller however it is found that the efficiency of an antenna using an inductively coupled feed is lower than an antenna using multiple folds After a comparison of the two methods the design of a thin multiply folded electrically small antenna is proposed for achieving high efficiency in a physically compact size The GA is used to assess the effect of geometry on the performance in terms of efficiency and bandwidth of the electrically small antennas including the folded conical helix and folded spherical helix Finally the prospects of using the new Yagi antennas to achieve small size are explored Yagi antennas are used widely to obtain high gain in a simple structures The antenna is composed of the driven element and the parasitic elements which include a reflector and one or more directors Typically sufficient spacing on the order of 0.15λ to 0.4λ between the driven element and the parasitic elements is needed for the Yagi antenna to operate well For some applications however it is desirable to reduce the spacing and the length of the elements to achieve a physically more compact size In this dissertation closely spaced folded Yagi antennas in both three dimensions and two dimensions are investigated and a design for an electrically small Yagi antenna is suggested Antenna Design for Cognitive Radio Youssef Tawk, Joseph Costantine, Christos
