Semiparametric and Nonparametric Econometrics Aman Ullah, 2012-12-06 Over the last three decades much research in empirical and theoretical economics has been carried on under various assumptions For example a parametric functional form of the regression model the heteroskedasticity and the autocorrelation is always assumed usually linear Also the errors are assumed to follow certain parametric distributions often normal A disadvantage of parametric econometrics based on these assumptions is that it may not be robust to the slight data inconsistency with the particular parametric specification Indeed any misspecification in the functional form may lead to erroneous conclusions In view of these problems recently there has been significant interest in the semiparametric nonparametric approaches to econometrics The semiparametric approach considers econometric models where one component has a parametric and the other which is unknown a nonparametric specification Manski 1984 and Horowitz and Neumann 1987 among others The purely nonparametric approach on the other hand does not specify any component of the model a priori The main ingredient of this approach is the data based estimation of the unknown joint density due to Rosenblatt 1956 Since then especially in the last decade a vast amount of literature has appeared on nonparametric estimation in statistics journals However this literature is mostly highly technical and this may partly be the reason why very little is known about it in econometrics although see Bierens 1987 and Ullah 1988
