Elephants and Savanna Woodland Ecosystems Christina Skarpe, Johan T. du Toit, Stein R. Moe, 2014-04-02 During the nineteenth century ivory hunting caused a substantial decrease of elephant numbers in southern Africa Soon after that populations of many other large and medium sized herbivores went into steep decline due to the rinderpest pandemic in the 1890s These two events provided an opportunity for woodland establishment in areas previously intensively utilized by elephants and other herbivores The return of elephants to currently protected areas of their former range has greatly influenced vegetation locally and the resulting potential negative effects on biodiversity are causing concern among stakeholders managers and scientists This book focuses on the ecological effects of the increasing elephant population in northern Botswana presenting the importance of the elephants for the heterogeneity of the system and showing that elephant ecology involves much wider spatiotemporal scales than was previously thought Drawing on the results of their research the authors discuss elephant caused effects on vegetation in nutrient rich and nutrient poor savannas and the potential competition between elephants on the one hand and browsers and mixed feeders on the other Ultimately this text provides a comprehensive review of ecological processes in African savannas covering long term ecosystem changes and human wildlife conflicts It summarises new knowledge on the ecology of the sub humid African savanna ecosystems to advance the general functional understanding of savanna ecosystems across moisture and nutrient gradients **Encyclopedia of Marine**

Krausman,Bruce D. Leopold,2013-03-15 Published in association with The Wildlife Society **Fish Physiology: Behaviour and Physiology of Fish** Katherine A. Sloman,Sigal Balshine,Rod W. Wilson,2005-12-13 Traditionally behaviour and physiology have been considered two separate fields of biology with the majority of available literature focusing on one or the other Recently the need for a multidisciplinary approach to these topics has been realised highlighted by some of the sessions to be held at the 2003 annual meeting of the Society for Integrative and Comparative Biology such as regulation of behaviour and mechanisms of behaviour The proposed volume aims to bring together these disciplines in a comprehensive review of the available literature Fish Physiology Behaviour and Physiology of Fish will be novel in actively bridging these two areas of fish biology together and considering them as inextricably linked The progression of chapters focuses on different aspects of the life history of a fish from predator avoidance through to reproduction each written by scientists currently bridging the gap between behaviour and physiology in their own specialised subdiscipline Multidisciplinary and integrative research in fish biology Written by internationally recognized researchers Encompasses the whole life span of fish A wide variety of inter related topics presented in a cohesive format **The Physics of Evolution** Michael W. Roth,2023-06-06 This book provides an introduction to the significant role of physics in evolution based on the ideas of matter and energy resource flow organism self copying and ecological change The text employs these ideas to create quantitative models for important evolutionary processes Many fields of science and engineering have come up against the problem of complex design when details become so numerous that computer power alone cannot make progress Nature solved the complex design problem using evolution yet how it did so has been a mystery Both laboratory experiments and computer simulation attempts eventually stopped evolving Something more than Darwin s ideas of heredity variation and selection was needed The solution is that there is a fourth element to evolution ecological change When a new variation is selected this can change the ecology and the new ecology can create new opportunities for even more new variations to be selected Through this endless cycle complexity can grow automatically This book uses the physics of resource flow to describe this process in detail developing quantitative models for many evolutionary processes including selection multicellularity coevolution sexual reproduction and the Serengeti Rules The text demonstrates that these models are in conceptual agreement with numerous examples of biological phenomena and reveals through physics how complex design can arise naturally This will serve as a key text on the part physics plays in evolution and will be of great interest to students at the university level and above studying biophysics physics systems biology and related fields
