Autonomous Robots George A. Bekey, 2005-05-20 An introduction to the science and practice of autonomous robots that reviews over 300 current systems and examines the underlying technology Autonomous robots are intelligent machines capable of performing

tasks in the world by themselves without explicit human control. Examples range from autonomous helicopters to Roomba the robot vacuum cleaner. In this book George Bekey offers an introduction to the science and practice of autonomous robots that can be used both in the classroom and as a reference for industry professionals. He surveys the hardware implementations of more than 300 current systems, reviews some of their application areas and examines the underlying technology including control architectures, learning, manipulation, grasping, navigation and mapping. Living systems can be considered the prototypes of autonomous systems and Bekey explores the biological inspiration that forms the basis of many recent developments in robotics. He also discusses robot control issues and the design of control architectures. After an overview of the field that introduces some of its fundamental concepts, the book presents background material on hardware control from both biological and engineering perspectives, software architecture and robot intelligence. It then examines a broad range of implementations and applications including locomotion, wheeled, legged, flying, swimming and crawling robots, manipulation, both arms and hands, localization, navigation and mapping. The many case studies and specific applications include robots built for research, industry and the military, among them underwater robotic vehicles, walking machines with four, six and eight legs and the famous humanoid robots Cog, Kismet, ASIMO and QRIO. The book concludes with reflections on the future of robotics, the potential benefits as well as the possible dangers that may arise from large numbers of increasingly intelligent and autonomous robots.

Intelligent Robotics and Applications Ming Xie, Youlun Xiong, Caihua Xiong, Zhencheng Hu, 2009-12-16. The market demands for skills, knowledge and personalities have positioned robotics as an important field in both engineering and science. To meet these challenging demands, robotics has already seen its success in automating many industrial tasks in factories. And a new era will come for us to see a greater success of robotics in industrial environments. In anticipating a wider deployment of intelligent and autonomous robots for tasks such as manufacturing, eldercare, homecare, edutainment, search and rescue, de-mining, surveillance, exploration and security missions, it is necessary for us to push the frontier of robotics into a new dimension in which motion and intelligence play equally important roles. After the success of the inaugural conference, the purpose of the Second International Conference on Intelligent Robotics and Applications was to provide a venue where researchers, scientists, engineers and practitioners throughout the world could come together to present and discuss the latest achievements, future challenges and exciting applications of intelligent and autonomous robots. In particular, the emphasis of this year's conference was on robot intelligence for achieving digital manufacturing and intelligent automations. This volume of Springer's Lecture Notes in Artificial Intelligence and Lecture Notes in Computer Science contains accepted papers presented at ICIRA 2009 held in Singapore, December 16-18, 2009. On the basis of the reviews and recommendations by the international Program Committee members, we decided to accept 128 papers having technical novelty out of 173 submissions received from different parts of the world.

Mechatronics by Bond Graphs Vjekoslav Damić, John Montgomery, 2016-01-14. This book presents a computer-aided approach to the design of mechatronic

systems Its subject is an integrated modeling and simulation in a visual computer environment Since the first edition the simulation software changed enormously became more user friendly and easier to use Therefore a second edition became necessary taking these improvements into account The modeling is based on system top down and bottom up approach The mathematical models are generated in a form of differential algebraic equations and solved using numerical and symbolic algebra methods The integrated approach developed is applied to mechanical electrical and control systems multibody dynamics and continuous systems
