Systems Engineering Using SDL-92 A. Olsen, 2012-12-02 CCITT now ITU T Specification and Description Language SDL and systems engineering formal and informal in SDL are considered in this publication The latest version of the language SDL 92 ITU Z 100 SDL 92 is introduced The book has been written for existing and potential users of SDL technologists involved in the specification and engineering of systems It offers easier learning through examples and application than the Z 100 Recommendation of March 1993 which gives precise technical definitions and concepts The book has sufficient coverage of the language so that for normal use it should not be necessary to consult Z 100 For this reason the grammars both textual and graphical are included and the index makes it possible to find text on most of the language mechanisms Chapter 1 provides an overview of specification and design of telecommunication systems It considers the usage and scope of SDL Chapter 2 gives an overview of the language with an introduction of the major language elements Chapter 3 focuses on the specification of behaviour and the information interchange between processes Chapter 4 covers the structuring of systems in terms of instances how these may be defined by types and how types may be organised in type subtype hierarchies by inheritance Parameterised types and packages of type definitions are also covered Chapter 5 presents the part of the language that provides data types with emphasis placed on how to use predefined data types Chapter 6 presents the use of SDL for system engineering with a discussion of general systems engineering principles followed by an introduction to methodologies which use SDL The use of other languages in combination with SDL documentation issues naming and other lexical rules errors and language support are considered since they are more relevant to the use of language in engineering than when initially learning the language

Systems Engineering with SDL

Andreas Mitschele-Thiel, 2001-02-08 SDL Specification and Description Language is a modern high level programming language intended for the description of complex event driven real time and communicating systems SDL was originally designed to describe performance critical real time systems with precision and accuracy and if used correctly it can significantly enhance the performance of system designs This text is unique in the integration between performance and design issues describing the specific problems encountered when specifying designing and implementing communication systems with SDL and offers experience based advice and solutions Other topics covered include Navigating through complex design processes Strategies for deriving efficient implementations from SDL descriptions The latest version of SDL SDL 2000 Systems Engineering with SDL also includes a CD ROM containing a demonstration version of Telelogic s SDL design suite Tau the market leading SDL design tool which further reinforces the comprehensive integration between theory and practice Written by a former system architect at Alcatel who currently serves on the ITU standards body for SDL responsible for the development of performance and time aspects of the standard this valuable reference resource is principally of use to practitioners using SDL to develop communicating systems communication protocols distributed systems embedded systems especially systems architects development engineers and tool builders making strategic design decisions However the comprehensive coverage and concise and practical style make this text also applicable to students on graduate level courses on protocol engineering communication systems engineering and distributed systems

Communication

Protocol Specification and Verification Richard Lai, Ajin Jirachiefpattana, 2012-12-06 Communication protocols are rules whereby meaningful communication can be exchanged between different communicating entities In general they are complex and difficult to design and implement Specifications of communication protocols written in a natural language e g English can be unclear or ambiguous and may be subject to different interpretations As a result independent implementations of the same protocol may be incompatible In addition the complexity of protocols make them very hard to analyze in an informal way There is therefore a need for precise and unambiguous specification using some formal languages

Many protocol implementations used in the field have almost suffered from failures such as deadlocks. When the conditions in which the protocols work correctly have been changed, there has been no general method available for determining how they will work under the new conditions. It is necessary for protocol designers to have techniques and tools to detect errors in the early phase of design because the later in the process that a fault is discovered, the greater the cost of rectifying it. Protocol verification is a process of checking whether the interactions of protocol entities according to the protocol specification do indeed satisfy certain properties or conditions which may be either general (e.g. absence of deadlock) or specific to the particular protocol system directly derived from the specification. In the 80s, an ISO International Organization for Standardization working group began a programme of work to develop formal languages which were suitable for Open Systems Interconnection (OSI). This group called such languages Formal Description Techniques (FDTs). Some of the objectives of ISO in developing FDTs were enabling unambiguous, clear and precise descriptions of OSI protocol standards to be written and allowing such specifications to be verified for correctness. There are two FDTs standardized by ISO: LOTOS and Estelle. Communication Protocol Specification and Verification is written to address the two issues discussed above: the needs to specify a protocol using an FDT and to verify its correctness in order to uncover specification errors in the early stage of a protocol development process. The readership primarily consists of advanced undergraduate students, postgraduate students, communication software developers, telecommunication engineers, EDP managers, researchers and software engineers. It is intended as an advanced undergraduate or postgraduate textbook and a reference for communication protocol professionals.

Systems Engineering Guidebook James N. Martin, 2020-04-30. Systems Engineering Guidebook: A Process for Developing Systems and Products is intended to provide readers with a guide to understanding and becoming familiar with the systems engineering process, its application, and its value to the successful implementation of systems development projects. The book describes the systems engineering process as a multidisciplinary effort. The process is defined in terms of specific tasks to be accomplished, with great emphasis placed on defining the problem that is being addressed prior to designing the solution.

Feature Interactions in Telecommunications Systems L. G. Bouma, H. Velthuisen, 1994. Features are modifications to the control of telecommunications services. A feature interaction occurs when the behaviour of another which can lead to unexpected or undesired behaviour which affects the quality of service. The goal of this volume is to generate a combination of techniques through protocol engineering, software testing, formal techniques, and AI and applications to telecommunications services.
