Municipal Wastewater Management in Developing Countries

Zaini Ujang, Mogens Henze, 2006-04-30 Municipal Wastewater Management in Developing Countries discusses various approaches to municipal wastewater management in order to protect both public health and the environment with the major focus being on waterborne diseases Developing countries can be divided into two main categories i.e. countries in transition with higher growth rates where industrialisation and urbanisation are taking place rapidly and countries with slower growth rates It is important therefore that approaches should be tailor made and site specific In general the major trends of water pollution control have significantly contributed to the development of conventional sanitation approaches in terms of legal and financial frameworks as well as technological enhancement Despite advances in the science engineering and legal frameworks 95 per cent of the wastewater in the world is released into the environment without treatment Only five per cent of global wastewater is properly treated using the standard sanitation facilities mainly in developed countries As a result the majority of the world's population is still exposed to waterborne diseases and the quality of water resources has been rapidly degraded particularly in poor developing countries The challenge now is to provide the world's population especially the poor with adequate water and sanitation facilities Despite billions of dollars of investment spent every year billions of poor people are still suffering and dying because of poor sanitation At the beginning of this century about 1.1 billion people lived without access to clean water compared to about the same number in 1990 2.4 billion without appropriate sanitation compared to 2.3 billion in 1990 and four billion without sound wastewater disposal The future scenario that water resources will be further depleted by a growing world population will be coupled with environmental degradation due to poor pollution control particularly in most of the developing countries In order to address the issue of water and wastewater management in developing countries it is necessary to take into consideration the segments of the society itself particularly the types of housing areas The segments will indicate the level of socio economic mentality and knowledge which is important for any planned changes in their life style and social engineering It is also important to segregate the funding framework of any proposed projects High income urban communities for instance are generally willing to pay for sewerage services and higher water supply tariffs therefore a designated system can be accordingly provided Over the past 10 years serious criticism has been given to the conventional sanitation approach consequently many definitions concepts and characteristics have been proposed on sustainable sanitation Sustainable sanitation is a relevant concept in order to achieve the Millennium

Development Goals by 2015 of providing water supply and adequate sanitation for developing countries Sustainable sanitation is flexible in approach any community poor or rich urban or rural water rich or water poor country and requires lower investment costs compared to conventional sanitation approaches It is also important to note that the framework of sustainable sanitation is much easier to adopt in developing countries where water supply and sanitation infrastructures are still in the developing stages In some developing countries no public facilities are available therefore it is an ideal condition to start a new infrastructure with a new framework This comprehensive reference prepared by leading international authorities will provide an invaluable reference for all those concerned with the management of sanitation services in developing countries worldwide *Biosolids Engineering* Michael McFarland,2001-01-10 Expert help for designing and managing a biosolids program So notoriously complex and occasionally controversial that it has paradoxically reduced biosolids applications in some locales CFR Part 503 becomes understandable manageable and doable with this expert guide from experienced environmental engineer Michael J McFarland diplomate of the American Academy of Environmental Engineers and certified Grade IV wastewater and water treatment operator If you have interest in or responsibility for fulfilling the intent of Part 503 putting biosolids and organic residues to beneficial use and decreasing the burden on landfills Biosolids Engineering can help you Control the factors in wastewater and biosolids processing that affect usability Apply soil chemistry and physics to finding safe and appropriate uses for biosolids Design needed hydraulic storage and transport systems Ensure pathogen and vector attraction reduction Make biosolids engineering a team effort with agricultural specialists mining engineers water treatment officials and highway transportation and timber specialists Apply sampling and analysis protocols for effectiveness and safety Increase public awareness of the safety and value of biosolids applications
