**Smoldering Fires** P. Lindsay Russell, 1912      Fire Phenomena and the Earth System Claire M. Belcher, 2013-04-08 Fire plays a key role in Earth system processes Wildfires influence the carbon cycle and the nutrient balance of our planet and may even play a role in regulating the oxygen content of our atmosphere The evolutionary history of plants has been intimately tied to fire and this in part explains the distribution of our ecosystems and their ability to withstand the effects of natural fires today Fire Phenomena and the Earth System brings together the various subdisciplines within fire science to provide a synthesis of our understanding of the role of wildfire in the Earth system The book shows how knowledge of fire phenomena and the nature of combustion of natural fuels can be used to understand modern wildfires interpret fire events in the geological record and to understand the role of fire in a variety of Earth system processes By bringing together chapters written by leading international researchers from a range of geological environmental chemical and engineering disciplines the book will stimulate the exchange of ideas and knowledge across these subject areas Fire Phenomena and the Earth System provides a truly interdisciplinary guide that can inform us about Earth's past present and beyond Readership Advanced students and researchers across a wide range of earth environmental and life sciences including biogeochemistry paleoclimatology atmospheric science palaeontology and paleoecology combustion science ecology and forestry

Finney, Sara S. McAllister, Jason M. Forthofer, Torben P. Grumstrup, 2021-11 Wildland fires have an irreplaceable role in sustaining many of our forests shrublands and grasslands They can be used as controlled burns or occur as free burning wildfires and can sometimes be dangerous and destructive to fauna human communities and natural resources Through scientific understanding of their behaviour we can develop the tools to reliably use and manage fires across landscapes in ways that are compatible with the constraints of modern society while benefiting the ecosystems The science of wildland fire is incomplete however Even the simplest fire behaviours how fast they spread how long they burn and how large they get arise from a dynamical system of physical processes interacting in unexplored ways with heterogeneous biological ecological and meteorological factors across many scales of time and space The physics of heat transfer combustion and ignition for example operate in all fires at millimetre and millisecond scales but wildfires can become conflagrations that burn for months and exceed millions of hectares Wildland Fire Behaviour Dynamics Principles and Processes examines what is known and unknown about wildfire behaviours The authors introduce fire as a dynamical system along with traditional steady state concepts They then break down the system into its primary physical components describe how they depend upon environmental factors and explore system dynamics by constructing and exercising a nonlinear model The limits of modelling and knowledge are discussed throughout but emphasised by review of large fire behaviours Advancing knowledge of fire

behaviours will require a multidisciplinary approach and rely on quality measurements from experimental research as covered in the final chapters

**Principles of Fire Risk Assessment in Buildings** David Yung, 2008-12-17 This book arrives at just the right time to facilitate understanding of performance based fire risk assessment in buildings an integral part of the global shift in policy away from traditional prescriptive codes Yung an internationally recognised expert on the subject of fire risk assessment introduces the basic principles and techniques that help the reader to understand the various methodologies that are currently in place or being proposed by different organisations Through his illustration of basic principles and techniques he enables the reader to conduct their own fire risk assessments He demonstrates how the probabilities of fire scenarios are assessed based on the probabilities of success and failure of fire protection measures that are in place He also shows how the consequences of fire scenarios are assessed based on the intensity and speed of fire and smoke spread the probability and speed of occupant response and evacuation and the effectiveness and speed of fire department response and rescue efforts Yung s clear and practical approach to this highly topical subject enables the reader to integrate the various tools available into a quantitative framework that can be used for decision making He brings an invaluable resource to all those involved in fire engineering and risk assessment including students academics building designers fire protection engineers structural engineers regulators and risk analysts

Modelling, Monitoring and Management of Forest Fires J. de las Heras, C.A. Brebbia, D. Viegas, V. Leone, 2008-08-26 At present there is insufficient knowledge of the behavior of fires and how they propagate This lack of information makes it very hard to control these phenomena and is one of the biggest obstacles to the development of a reliable decision support system Public concern regarding this topic is increasing as uncontrolled fires may lead to major ecological disasters and usually result in negative economic and health implications for the region Containing papers presented at the First International Conference on Modelling Monitoring and Management of Forest Fires this book addresses the latest research and applications of available computational tools to analyse and predict the spread of forest fires in order to prevent or reduce major loss of life and property as well as damage to the environment Such tools must be able to take into consideration a large number of different parameters The book thus deals with all aspects of forest fires from fire propagation in different scenarios to the optimum strategies for fire fighting It also covers issues related to economic ecological social and health effects Featured topics include Computer Models for Fire Propagation Risk and Vulnerability Assessment Fire Combustion Models Computational Methods and Experiments Case Studies Emergency Response Systems Optimization Models for Fire Mitigation Environmental Impact Models Air Pollution and Health Risk Interaction between Meteorological and Forest Fires Models Economic Impact Models Forest Material Characterisation Eco Remediation Models Decision Support Systems Monitoring Systems and Data Acquisition and Analysis
