This paper reviews some of the important technical barriers that must be overcome to achieve truly efficient flying adaptive  
micro air vehicles MAVs As defined by the Defense Advanced Research Agency DARPA MAVs are vehicles with no length  
dimension greater than 6 inches These vehicles typically weigh less than 100 grams and some can fly for approximately 30  
minutes Over the past decade significant progress has been made in developing these small scale mechanical flying machines  
However there is still much work to be done if these vehicles are to approach the efficiency and performance of biological  
fliers This paper reviews the status of current miniature mechanical flying machines and compares their performance with  
common biological flyers such as birds and small insects This comparison reveals that advances in aerodynamic efficiency  
lightweight and adaptive wing structures energy conversion propulsion systems and flight control are required to match or  
exceed the performance of nature s great flyers      **Mathematics and Control in Smart Structures** Society of
