**Fossil Horses of South America** José Luis Prado, María Teresa Alberdi, 2017-04-25 This book provides an update on the phylogeny systematics and ecology of horses in South America based on data provided over the past three decades The contemporary South American mammalian communities were shaped by the emergence of the Isthmus of Panama and by the profound climatic oscillations during the Pleistocene Horses were a conspicuous group of immigrant mammals from North America that arrived in South America during the Pleistocene This group is represented by 2 genera *Hippidion* and *Equus* which include small species *Hippidion devillei* *H. saldiasi* *E. andium* and *E. insulatus* and large forms *Equus neogeus* and *H. principale* Both groups arrived in South America via 2 different routes One model designed to explain this migration indicates that the small forms used the Andes corridor while larger horses used the eastern route and arrived through some coastal areas Molecular dating ancient DNA suggests that the South American horses separated from the North American taxocaballines and the New World stilt legged horse after 3.632 Ma consistent with the final formation of the Panamanian Isthmus Recent studies of stable isotopes in these horses indicate an extensive range of  $\delta^{13}\text{C}$  values cover closed woodlands to  $\text{C}_4$  grasslands This plasticity agrees with the hypothesis that generalist species and open biome specialist species from
