Fluid Balance & Filtration

The urinary system

The urinary system is responsible for three major functions in the body: removing wastes, maintaining normal water volume, and controlling salt-balance in the bloodstream. The individual components of the urinary system (kidneys, ureters, bladder, and urethra) each play an important role in these processes.

Urine formation begins within the functional units of the kidneys called nephrons. A nephron, following processes of filtration, reabsorption, and secretion, removes metabolic wastes, allows important substances such as glucose and water to be passed back into the blood, and eliminates wastes such as drugs and poisons. The filtrate that results from this process is eventually diluted with water to produce urine.

The kidney

The kidneys are located on each side of the spine at the back of the abdominal cavity. Each kidney is approximately 10 x 5 inches long and contains two to three million renal or functional tubules called a nephron. The two kidneys have a pair of ureters, however, we can survive with a single kidney.

Within the kidney are two main regions. The outer rim is the renal cortex, which contains the nephrons. The innermost tubule that filters blood from the kidney, the inner region is the renal medulla. It consists of many cone-shaped structures (renal pyramids) that transport urine to the pelvis. Cup-shaped structures in the center of the kidney, the calyces drain into the renal pelvis, a central chamber that connects directly to the ureter.

The nephron

Each kidney contains more than a million nephrons, the microscopic units located in the renal cortex. A single nephron is made up of two components: the renal corpuscle, the proximal convoluted tubule, the loop of Henle, and the distal convoluted tubule.

Filtration

As blood flows through the glomerular capillary blood pressure creates a force that pushes fluid and dissolved substances through the filtration apparatus. There are three parts to the apparatus: the capillary walls, the basement membrane, and the glomerular epithelium. The pores in the glomerular capillary are large enough to allow plasma and solutes to diffuse, but too small for blood cells to pass. The basement membrane, however, allows fluid and some solutes that a typical basement membrane. This allows smaller proteins and molecules to pass but not larger proteins.

The outer surface of the basement membrane is covered with podocytes, specialized cells with long processes, or pedicels, that wrap around the capillaries. The pedicels are separated by very narrow gaps called slit diaphragms. The combination of high fluid pressure, extremely permeable basement and large slit diaphragms create a force that allows a large volume of fluid to be filtered.

ADH and fluid levels

ADH & fluid volume

ADH, or antidiuretic hormone, increases the permeability of the collecting ducts, which increases the reabsorption of water. ADH is produced in the hypothalamus and stored in the posterior pituitary. The hypothalamus responds to changes in blood volume by changing the amount of ADH that is sent into the system. This is an example of a negative feedback process that helps to maintain blood volume levels within a certain range.

Filtrate formation in the nephron

How urine is produced

The kidney process an average of 180 quarts of blood daily, eventually excreting only about 2 quarts of water and waste products in urine. Urine production begins when blood enters the nephrons, where a complex process of reabsorption and secretion along the renal tubule, concentrated urine containing water and wastes such as sodium and urea is produced. Urine eventually flows toward the renal pelvis, the collecting ducts.

The composition of urine

Key stages of urine formation

- Filtration** - Filtering of water, waste products, sodium, glucose and other chemicals
- Reabsorption** - Movement of usable substances back to the bloodstream
- Secretion** - Transport of waste materials from capillaries around the renal tubule back into the distal tubule for removal with the urine
