The Human Gait

Wilhelm Braune, Otto Fischer

The Human Gait:

The Human Gait Wilhelm Braune, Otto Fischer, 2012-12-06 The different chapters of the present book were published separately each as a complete entity in the Proceedings of the Royal Saxon Society for Sciences Chapter 1 appeared in 1895 under the names of Wilhelm Braune and Otto Fischer although Braune died immediately after the initial experiments before the recordings had been interpreted Chapters 2-6 were signed by Fischer only and appeared in 1899 1900 1901 1903 and 1904 Basic data needed for this investigation of the human gait had been provided previously A research on the centre of gravity of the human body and its different segments by both authors was published in 1889 determination of the moments of inertia of the human body and its segments in 1892 So far only the first of these two works has been published in English The other has been translated and awaits publication Springer Verlag must be congratulated for the quality of this edition and for the care they took in reproducing the original figures This was certainly no easy task We thank them for the patience they displayed towards the translators Publication of the present book was made possible financially by Prof M Muller Bern We are grateful to him for his generosity and so will be the scientific community

Adaptability of Human Gait A.E. Patla, 1991-03-25 A large number of volumes have been produced summarizing the work on generation and control of rhythmic movements in particular locomotion Unfortunately most of them focus on locomotor studies done on animals This edited volume redresses that imbalance by focusing completely on human locomotor behaviour The very nature of the problem has both necessitated and attracted researchers from a wide variety of disciplines ranging from psychology neurophysiology kinesiology engineering medicine to computer science The different and unique perspectives they bring to this problem provide a comprehensive picture of the current state of knowledge on the generation and regulation of human locomotor behaviour A common unifying theme of this volume is studying the adaptability of human gait to obtain insights into the control of locomotion The intentional focus on adaptability is meant to draw attention to the importance of understanding the generation and regulation of skilled locomotor behaviour rather than just the generation of basic locomotor patterns which has been the major focus of animal studies The synthesis chapter at the end of the volume examines how the questions posed the technology and the experimental and theoretical paradigms have evolved over the years and what the future has in store for this important research domain
