Biomechanical Analysis of Slipped Capital Femoral Epiphysis with Single and Double Screw Fixation Robert Martin Doane,1990 **A Finite Element Study of Slipped Capital Femoral Epiphysis (SCFE)** ,2005 Dysplastic changes of an adolescent hip may increase mechanical stresses at the proximal femoral physis and result in a slipped capital femoral epiphysis SCFE The purpose of this study is to determine the effect of body weight femoral retroversion and acetabular deepening on stresses and strains at the proximal femoral physis A computer tomography scan of a 13 year old child with SUE was used to generate a solid model of the proximal femur and physis to be analyzed using the finite element method Body weights of 46 kg and 86 kg were considered with single legged stance The physis is modeled using both elastic and viscoelastic tissue models using two different finite element procedures Physis stresses and strains were found to increase with change in biomechanical factors such as greater body weight retroversion of the femoral neck and hyper coverage of the femoral head Larger maximum displacement values were found with the increase in biomechanical factors under consideration Similar trends were found with the elastic and viscoelastic models however the strain values found in the viscoelastic model were much higher than those in elastic model When combined with increase body weight and retroversion of the femoral head with acetabular deepening the loads experienced by the physis may exceed the ultimate strength of the growth plate tissue resulting in a slip Therefore these biomechanical factors could be considered as risk factors for development of SCFE **Slipped Capital Femoral Epiphysis** Beckett Howorth,1966 *Studies in Slipped Capital Femoral Epiphysis* Theodore Ronald Simon,1975 **Slipped Capital Femoral Epiphysis Caused by an Implant - a Case Report** Manukaran M. Symposium Slipped Capital Femoral Epiphysis William W. Robertson, Lee S. Segal, 1996

Slipped Capital Femoral Epiphysis Molly A. Moor, 2010 Background Slipped Capital Femoral Epiphysis SCFE is the most common hip disorder among adolescents A controversial subset of SCFE patients are those who experience a unilateral slip followed by a slip on the opposite hip known as a contralateral slip To prevent the development of a contralateral slip some physicians prophylactically pin the unaffected hip of patients they suspect may eventually develop a contralateral SCFE However there is no definitive protocol with which to predict if a child will develop a contralateral slip The goal of this retrospective study was to develop a clinical tool to assist physicians and patients in deciding whether or not to perform prophylactic contralateral hip pinning after first diagnosis of SCFE Methods A retrospective medical record review was conducted to gather information about patients who were treated for SCFE at the

Rady Children's Hospital San Diego between 1997 and 2009 Demographic information was collected from all participants who were treated for SCFE and only patients with two or more years of post operative care were included in the study Results A total of 299 participants were included in the study of whom 162 54% had a unilateral SCFE 39 13% presented with an initial unilateral slip and further developed a contralateral SCFE 47 16% had a unilateral SCFE and underwent prophylactic pinning for the unaffected hip and 51 17% had simultaneous bilateral slips A sub analysis was performed with the 201 patients who had unilateral involvement After simultaneous adjustment for age endocrine condition and slip type the following associations were observed increasing age was found to be protective of contralateral SCFE OR 0.72 95% CI 0.56-0.93 presence of underlying endocrine condition was associated with an increase in contralateral SCFE OR 3.94 95% CI 1.02-15.21 and acute on chronic slips had higher odds of contralateral SCFE development than acute or chronic slips OR 2.98 95% CI 1.14-7.77 Conclusions Results from this study can be incorporated into the clinical arena to use as a tool for assisting physicians in determining whether or not to prophylactically pin a patient with a unilateral SCFE For clinical decision making this model should not be used as an independent assessment tool rather it should be considered as a reference to consult in conjunction with the other published studies and decision models

Defining the Three-dimensional Deformity in Slipped Capital Femoral Epiphysis Alan G. Valdovino, 2019 The purpose of this study was to define a novel angle measure theta characterizing true slipped capital femoral epiphysis SCFE deformity use theta to differentiate between SCFE hips contralateral unaffected hips and normal hips and to compare theta to the Southwick slip angle SSA 3DCT reconstructions of the pelvis and femurs were obtained and pelvic position was standardized The center point and direction vector of the femoral epiphysis was determined The femoral neck axis was defined The angle between the femoral neck axis and epiphysis vector defined the 3D angle of deformity theta The 3D translation of the femoral epiphysis measured as a percentage of femoral neck diameter was measured in three planes The average theta angle was significantly greater in SCFE hips 44.9 22.5 compared to control 14.5 8.8 or normal 14.0 6.5 hips p
