Dynamics of Nonlinear Cross-equatorial Flow in the Deep Ocean Christopher Andrew Edwards, 1996 The transformation of potential vorticity within and stability of nonlinear deep western boundary currents in an idealized tropical ocean are studied using a shallowwater model Observational evidence indicates that the potential vorticity of fluid parcels in deep western boundary currents must change sign as they cross the equator but this evidence is otherwise unable to clarify the process A series of numerical experiments investigate this transformation in a rectangular basin straddling the equator A mass source located in the northwestern corner feeds fluid into the domain where it is constrained to cross the equator to reach a distributed mass sink Dissipation is included as momentum diffusion The Reynolds number defined as the ratio of the mass source per unit depth to the viscosity determines the nature of the flow and a critical value Rec divides its possible
