The Immunopathology Of Lymphoreticular Neoplasms:

The Immunopathology of Lymphoreticular Neoplasms J. Twomey, 2012-12-06 Until recently understanding of the lymphomas was limited and largely descriptive. Attention has been focused for the most part upon morphological issues and clinical matters. Although useful, this approach has many shortcomings. The true cytoidentity of primary neoplastic cells was not established by these methods nor could their clonal nature be recognized. The more overt changes in immunological function such as monoclonal gammopathies and immunodeficiencies were appreciated as important components of these diseases. However, subtle immunological perturbations were not recognized. Furthermore, associations were not established between the lymphoreticular neoplasms on the one hand and both primary and secondary immunological abnormalities on the other. There has been considerable recent progress in the fields of immunobiology, cytology and immunochemistry. These new approaches have proved readily applicable to studies on the lymphomas. The term lymphoma has been applied to a heterogeneous group of neoplasms that involve lymphoid tissues. This term is not altogether satisfactory since it implies that cells of primarily the lymphoid series are involved in the neoplastic process. Some neoplasms heretofore classified as lymphomas now appear from the results of penetrating analysis using newer methodology to be malignancies of the macrophage series rather than of the lymphocytic series. These neoplasms include Hodgkin's disease and a minority of neoplasms previously referred to as histiocytic lymphomas. The majority of these histiocytic lymphomas are now known to be lymphoid malignancies involving the B cell series.

Twomey, 1978-10-01 *Current Catalog* National Library of Medicine (U.S.), 1985. First multi-year cumulation covers six years 1965-70. **Handbook of Mucosal Immunology**, 2012-12-02. Researchers have recently made tremendous progress in the area of mucosal immunology, greatly increasing our understanding of the common mucosal immune system, mucosal infections and oral immunization. However, this research has not previously been made available in a single work. In its large 81 x 11 format, *Handbook of Mucosal Immunology* covers the entire spectrum of mucosal immunity and is organized in two main sections to present the basic biology of the common mucosal immune system and the immune responses of the mucosae. The first section provides an introduction and historical perspective of the mucosal immune system and includes a comprehensive discussion of the development and physiology of mucosal defense. It discusses such topics as the structure and function of the mucosal epithelium, characteristics of mucosal-associated lymphoid tissue (MALT), Peyer's patches and concepts of mucosal vaccines. The second section focuses on the secretory immune system with special reference to mucosal diseases in the digestive, GALT, respiratory, BALT and genitourinary tracts. This information is especially important in light of the current interest in the mechanisms of transmission and prevention of infectious diseases such as AIDS, hepatitis and tuberculosis. Virtually all chapters have been authored by the original investigators responsible for key observations on which current concepts are based. This handbook will be an invaluable resource for a diverse group of both researchers and

practicing clinicians Molecular biologists immunologists veterinarians public health workers physicians in specialties from pediatrics to pulmonology and graduate students of mucosal immunology will all find this handbook the most complete work on the subject Immunology of Human Infection André J. Nahmias, Richard J. O'Reilly, 2012-12-06 When we were first approached by the senior editors of this series to edit a book on interactions between the host and infectious agents we accepted this offer as an exciting challenge The only condition readily agreed upon was that such a book should focus on the immunology of infections in humans Our reasons if not biases were severalfold We sensed that the fields of microbiology and immunology which had diverged as each was focusing on its individual search were coming together In agreement with the opinions expressed by Dr Richard Krause in the Introduction we strongly believed that the development of the immune system evolved in response to infectious agents and that the evolution of these agents was influenced in turn by the character of the host's responses An intensive examination of the multitude of primitive or more recently developed host defense mechanisms to determine their relative contribution to man's resistance to a given infectious agent appeared to us to be of crucial basic and practical interest Many immune mechanisms studied in animals were being explored in humans and it appeared timely to focus particularly on what was known about man's resistance to infectious agents correlating this information with lessons learned from relevant experiments in animal models **Biology of Tumors: Surfaces,**

Immunology, and Comparative Pathology Frederick Becker, 2013-04-17 As was shown in the first two volumes of this series great strides have been made in identifying many of the agents or classes of substances responsible for carcinogenesis and in delineating their interactions with the cell Clearly the aim of such studies is that once identified these agents can be eliminated from the environment Yet despite these advances and the elimination of some important carcinogenic agents one major problem exists It is a constant monitor of all oncologic study and diminishes the importance of every experiment and of every clinical observation As we noted earlier that problem is our inability to define the malignant cell It is through studies of the fundamental biology of tumors that we seek this definition A vast amount of information has been gathered which describes what this cell does and to a lesser extent how it does it But the why evades us We have been unable to define the malignant cell save in broad terms by comparing it to its normal counterpart The major problem appears to be that the malignant cell does so much It is a chimera mystifyingly composed of normal activities and structures of phenotypic schizophrenia with embryonic fetal and adult characteristics and occasionally a hint of an unclassifiable capacity unique to malignant cells *National Library of Medicine Current Catalog* National Library of Medicine (U.S.), 1983

Immunodermatology Bijan Safai, Robert A. Good, 2013-11-11 By 1940 immunological mechanisms had been proved to have fundamental influences on a great number and variety of skin reactions and skin diseases had brought to light a great number of fundamental immunological mechanisms that were basic to a wide range of different diseases dermatological and nondermatological The preeminence of dermatological research in the advancement of immunological knowledge should not

astonish anyone For the skin is not only the most easily accessible tissue for producing and studying immunological reactions it is also the great organ of protection that meets the first onslaughts of inimical environmental forces and agents potential enemies both living and dead And protection is in essence what immunology is all about To get an idea of the long established role that testing the skin and the study of its many reactions has played in advancing general immunology one need recall only smallpox vaccination tuberculin testing testing with fungal extracts skin testing in hay fever asthma and serum sickness skin tests with toxins and toxoids the patch test the passive transfer of skin adhering antibodies reagins skin sensitization by simple chemicals and similar dermatological procedures that have exerted their influence on medical and scientific disciplines far beyond dermatology
