Scientific Analysis of Cultural Heritage Objects Michael Wiescher,Khachatur Manukyan,2022-05-31 The characterization of cultural heritage objects becomes increasingly important for conservation restoration dating and authentication purposes

The use of scientific methods in archaeometry and conservation science has led to a significant broadening of the field. Scientific analysis of these objects is a challenging task due to their complex composition, artistic and historical values, requiring the use of minimally invasive and nondestructive analytical procedures. This textbook summarizes scientific methods that are currently used to characterize objects of cultural heritage and archaeological artifacts. This book provides a brief description of the structure of matter at the molecular, atomic, and nuclear levels. Furthermore, it discusses the chemical and physical nature of materials from the molecular to the atomic and nuclear level as determined by the principles of quantum mechanics. Important aspects of natural and anthropogenic radioactivity that play a critical role for some of the analytical techniques are also emphasized. The textbook also provides principles and applications of spectroscopic methods for characterization of cultural heritage objects. It describes the technologies with specific examples for utilization of spectroscopic techniques in the characterization of paintings, books, coins, ceramics, and other objects. Analytic approaches that employ isotopes and determination of isotope ratios will be reviewed. General principles of imaging techniques and specific examples for utilization of these methods will also be summarized. In the later part of the book, a number of scientific techniques for the age determination of cultural heritage material and archaeological artifacts will be presented and discussed with specific examples.

Skeletal Variation and Adaptation in Europeans Christopher B. Ruff, 2018-03-27. A comprehensive analysis of changes in body form and skeletal robusticity from the Terminal Pleistocene through the Holocene, leading to the modern European human phenotype. *Skeletal Variation and Adaptation in Europeans: Upper Paleolithic to the Twentieth Century* brings together for the first time the results of an unprecedented large-scale investigation of European skeletal remains. The study was conducted over ten years by an international research team and includes more than 2,000 skeletons spanning most of the European continent over the past 30,000 years from the Early Upper Paleolithic to the 20th century. This time span includes environmental transitions from foraging to food production, small-scale to large-scale urban settlements, increasing social stratification, and mechanization of labor and climatic changes. Alterations in body form and behavior in response to these transitions are reconstructed through osteometric and biomechanical analyses. Divided into four sections, the book includes an introduction to the project and comprehensive descriptions of the methods used, general continent-wide syntheses of major trends in body size, shape, and skeletal robusticity, detailed regional analyses, and a summary of results. It also offers a full data set on an external website. Brings together data from an unprecedented large-scale study of human skeletal and anatomical variations. Includes appendix of specific information from each research site. Synthesizes data from spatial, temporal, regional, and geographical perspectives. *Skeletal Variation and Adaptation in Europeans* will be a valuable resource for bioarchaeologists, palaeoanthropologists, forensic anthropologists, medical historians, and archaeologists at both the graduate and postgraduate level.
