Lowimpact development an integrated design approach ,2017 This thesis investigates sustainable storm water management in an alpine case study in the eastern part of Innsbruck Firstly the focus lies on the ecological properties of concepts such as Low Impact Development LID Water Sensitive Urban Design WSUD Sustainable Drainage System SuDS and Blue Green Infrastructure BGI especially with regard to the site conditions in the study area Through a literature research no specific impediments which would hinder an potential implementation could be detected However there are still general obstacles that discourage a more intensive utilization In the practical part the Urban Biophysical Environments Technologies Simulator UrbanBEATS a dedicated software for the planning of sustainable storm water management is used to detect suitable types and locations for the elements of sustainable storm water management in the study area In a further step the Storm Water Management Model SWMM of the United States Environmental Protection Agency USEPA is applied in order to assess the hydrological performance in quantitative terms The performance during five different storm events are recorded and show a peak runoff reduction up to 4 26% in the total system a peak flooding reduction up to 20 28% and a flooding volume reduction up to 17 49%

Post-Project Monitoring of BMP's/SUDS to Determine Performance and Whole-Life Costs L. K. Lampe, 2004-06-30 Over the past 20 years the use of Best Management Practices BMPs in the United States has been instrumental in reducing both the detrimental impacts to receiving water quality and the exacerbated flooding caused by urbanization and storm water drainage More recently Sustainable Urban Drainage Systems SUDS have started to be used in the United Kingdom Both SUDS and BMPs attempt to mimic the drainage patterns of the natural watershed and can also provide a degree of treatment needed to improve the quality of the water discharged to an acceptable level The costs of conventional stormwater collection systems are determined primarily in terms of initial capital expenditure Long term maintenance costs are absorbed by stormwater authorities that are responsible for maintaining their infrastructure as part of their asset base Currently only a few of these responsibilities exist for BMPs and SUDS which generally incorporate surface components and are often dependent on landscaping rather than on traditional construction techniques but may require significant regular maintenance Any potential adopting organization will require guidance on the maintenance regimes of different types of systems and how such regimes translate into long term adoption costs The project is being conducted in two phases Phase 1 which is the subject of this report includes a literature review and a survey of stormwater authorities and organizations in the US and UK to identify the

most commonly used BMPs and SUDS and to determine the availability of data on their cost and performance As part of Phase 2 the operation of selected BMPs and SUDS will be monitored over a one year period in terms of pollutant removal and hydrologic hydraulic efficiency and applicability of their design criteria and maintenance regime The protocols developed in Phase 1 will be used to assess BMPs SUDS performance and whole life costs National Conference on Tools for Urban Water Resource Management and Protection proceedings, February 710, 2000, Chicago, IL. , Stormwater Effects Handbook G. Allen Burton Jr.,Robert Pitt,2001-08-29 A stand alone working document Stormwater Effects Handbook A Toolbox for Watershed Managers Scientists and Engineers assists scientists and regulators in determining when stormwater runoff causes adverse effects in receiving waters This complicated task requires an integrated assessment approach that focuses on sampling before during and aft **National Conference on Tools for Urban Water Resource Management and Protection ,2000 Urban Stormwater Management in the United States** National Research Council,Division on Earth and Life Studies,Water Science and Technology Board,Committee on Reducing Stormwater Discharge Contributions to Water Pollution,2009-03-17 The rapid conversion of land to urban and suburban areas has profoundly altered how water flows during and following storm events putting higher volumes of water and more pollutants into the nation s rivers lakes and estuaries These changes have degraded water quality and habitat in virtually every urban stream system The Clean Water Act regulatory framework for addressing sewage and industrial wastes is not well suited to the more difficult problem of stormwater discharges This book calls for an entirely new permitting structure that would put authority and accountability for stormwater discharges at the municipal level A number of additional actions such as conserving natural areas reducing hard surface cover e g roads and parking lots and retrofitting urban areas with features that hold and treat stormwater are recommended Low-impact Development ,2000 National Management Measures to Control Nonpoint Source Pollution from Urban Areas ,2005
