Dynamics of Advanced Materials and Smart Structures Kazumi Watanabe, Franz Ziegler, 2013-04-17 Two key words for mechanical engineering in the future are Micro and Intelligence It is well known that the leadership in the intelligence technology is a matter of vital importance for the future status of industrial society and thus

national research projects for intelligent materials structures and machines have started not only in advanced countries but also in developing countries. Materials and structures which have self sensing diagnosis and actuating systems are called intelligent or smart and are of growing research interest in the world. In this situation the IUTAM symposium on Dynamics of Advanced Materials and Smart Structures was a timely one. Smart materials and structures are those equipped with sensors and actuators to achieve their designed performance in a changing environment. They have complex structural properties and mechanical responses. Many engineering problems such as interface and edge phenomena, mechanical and electro magnetic interaction, coupling and sensing, actuating and control techniques arise in the development of intelligent structures. Due to the multi disciplinary nature of these problems, all of the classical sciences and technologies such as applied mathematics, material science, solid and fluid mechanics, control techniques and others must be assembled and used to solve them. IUTAM well understands the importance of this emerging technology. An IUTAM symposium on Smart Structures and Structronic Systems, chaired by U

Written by a highly respected figure in structural health monitoring, this book provides readers with the technical skills and practical understanding required to solve new problems encountered in the emerging field of health monitoring. The book presents a suite of methods and applications in loads identification, usage monitoring, in situ damage identification, diagnostics and damage and performance prediction, prognostics. Concepts in modelling, measurements and data analysis are applied through real world case studies to identify loading, assess damage and predict the performance of structural components as well as examine engine components, automotive accessories, aircraft parts, spacecraft components, civil structures and defence system components. In particular, the book provides the reader with a fundamental and practical understanding of the material, discusses models demonstrating the physical basis for health monitoring techniques, gives a detailed review of the best practices in dynamic measurements including sensing, presents numerous data analysis techniques using model and signal based methods, discusses case studies involving real world applications of health monitoring, offers end of chapter problems to enhance the study of the topic for students and instructors, and includes an accompanying website with MATLAB programs providing hands on training to readers for writing health monitoring model simulation and data analysis algorithms. *Health Monitoring of Structural Materials and Components* is an excellent introductory text for newcomers to the subject as well as an excellent study tool for students and lecturers. Practitioners and researchers, those with a greater understanding and

application of the technical skills involved will also find this essential reading as a reference text to address current and future challenges in this field The wide variety of case studies will appeal to a broad spectrum of engineers in the aerospace civil mechanical machinery and defence communities      **Additive Manufacturing** T.S.
